TWO THOUSAND SQUARE MILES OF COAL

An illustrated article dealing with the vast anthracite deposits at Ground Hog Mountain. "The greatest economic discovery yet made in British Columbia."

X VICTORIA HARBORS

A story by Ernest McGaffey on the extensive harbor works now in hand at Victoria.

PRINCE RUPERT

The possibilities of the coming port of Northern British Columbia.

THE CHALLENGE OF THE MOUNTAINS

A series of beautiful pictures of the Rocky Mountains along the line of the Canadian Pacific Railway.

WE ARE MAKING BRITISH COLUMBIA BETTER KNOWN

MAPLE BAY

Vancouver Island

DUNCAN

350 ACRES with half a mile of waterfrontage on Maple Bay, the summer resort of Cowichan Valley. Seventy acres of this place is in crop; 75 acres in pasture, which can be brought under cultivation with little expense; the balance is in light timber. There is abundance of water in the driest season. The soil is very rich and can produce an exceptional yield of potatoes, grain or fruit. There is a stone dwelling, also barns and outhouses. The situation is ideal for a home, and the fishing and shooting cannot be surpassed in the valley.

Price—\$45,000; one-third cash; balance 1 and 2 years.

200 ACRES good land, unimproved, close in to Duncan, at \$50 per acre, on terms.

CHEMAINUS

530 ACRES of A1 land; 90 acres are cultivated and at present in crop. The soil is principally a rich, red loam which averages 3 feet deep, but there is one piece of 70 acres of black loam. Altogether there are not more than 5 acres of waste land. Of the 440 acres uncultivated about 300 have been logged over and make splendid pasture, the balance is in alder with light clearing. Plenty of water all the year. Two government roads run by the property, which is half

a mile from Chemainus town and station and half a mile from the sea. There is a small house, and barn, 24x80, in good repair. Besides stock sold in the Fall the owner wintered 25 head of cattle and sold 30 tons of hay, 15 tons of potatoes and 20 tons of roots. This place would be specially suited for a cattle ranch or would subdivide well.

Price—\$45,000; cash, \$15,000; balance arranged on easy terms.

WATERFRONTAGE

50 ACRES of choice waterfrontage at Chemainus, partly improved.

Price—\$7,500, on terms.

Peace River Farm Lands

The Peace River District of Western Canada now holds the attention of the whole world. This district at no distant date will be the home of a million prosperous farmers. IT IS THE GREATEST AND BEST FARM LAND IN CANADA.

It is the closest farm land to terminal elevator accommodation, thus having the shortest haul for its grain.

The Government of Alberta have recently guaranteed the bonds for the construction of three lines of railway into the Peace River country. These are under construction now.

We have for sale the only land that can be purchased in the Peace River District.

It is situated on the boundary line between Alberta and British Columbia and immediately south of the Dominion Government homestead reserve. It adjoins the well-known Grande Prairie District, where hundreds of farmers are now pouring in.

Price of our land is \$8 TO \$10 PER ACRE, and we only have 12,000 acres for sale. Half sections or full sections as desired.

This land in a couple of years will be worth \$25 or more per acre.

YOU want this land. This price will not appear again. When this land is gone there is no more.

Reap the Harvest But Sow the Seed Now

WE are offering for sale choice residential lots on most advantageous terms, with conditions for securing charming home surroundings, such as never before offered in Vancouver.

You cannot afford to pass this over lightly if you want a choice homesite or an investment that will give you most satisfactory returns in the near future.

These lots are in the Royal Nurseries Sub-division, being the easterly portion of the Royal Nurseries Ltd. property at Royal on Magee Road, a short distance from Granville Street and a few minutes' walk from Magee Station, on the B. C. Electric Railway.

**NO WAITING FOR TRAM CARS OR
GOOD ROADS**

In fifteen minutes you can reach these lots from the Post Office, Vancouver, in your auto, via Granville Street and Magee Road, on bitulithic pavement, and not exceed the speed limit, or you can take the B. C. Electric Railway to Magee Station.

It will be readily seen by looking at the index map that these lots are well situated.

\$150 WORTH OF NURSERY STOCK FREE

The Royal Nurseries, Limited, will give free of cost, to be planted by the purchaser on each lot purchased, \$150 worth of shade trees, shrubbery, roses, holly, fruit trees, hedge stock, herbaceous plants, etc., as may be selected from their stock, on basis of their regular selling prices.

In addition to the above, they will set out cut leaf birch along each boulevard on Mayfair Street.

These lots are under perfect cultivation; deeply ploughed; free from roots and boulders; now under second crop and in A1 shape to plant your nursery stock. This provides that your home and your neighbors' homes will be envired in a bower of beauty at once, without waiting years for results.

Price lists will be mailed free on application.

Reap the harvest by sowing the seed now.

STOCK RANCHES FOR SALE

We make a specialty of handling good stock ranches, and have them with from 1,000 up to 25,000 acres of Crown-granted lands, and with from 100 up to 2,500 head of stock on a property as going concerns, at prices that will insure good interest on the money asked for them. We have nothing at a valuation of less than \$10,000 that we would care to recommend.

Mining started in British Columbia in the year 1858, when the discovery of gold was made in the Cariboo country. To supply the miners with beef, cattle were brought in from Oregon, U.S.A. In the year 1860 cattle-raising was started in a small way on the Fraser River and the Chilcotin River, where it proved most successful. The industry quickly spread up and down the valleys of the Thompson, Nicola, Similkameen and Okanagan. From that time for the best part of twenty years the cattlemen practically controlled

the interior, or central part of the province. During that time 320-acre homesteads grew into holdings of from 1,000 up to 100,000-acre tracts of the choicest lands in the choicest parts of the province. Some of these holdings have since changed hands and been turned into fruit land, but some of them are still intact. It is property of this class that we are handling.

If you will deal with us direct we can in a great many cases sell you large blocks of this class of land, fully stocked with cattle and horses, as going concerns, at less per acre than you are being asked by speculators to pay for an inferior grade of wild, unimproved land.

In some cases the live stock and improvements on property we are handling represent a value of fully 50 per cent. of the total price asked.

If you want more information, write to or call on

Two Thousand Square Miles of Coal

THE GROUND HOG MOUNTAIN DISCOVERIES

By Archibald Collins, F.G.S.

IN the annual report of the Minister of Mines of British Columbia for last year it is shown that the output of mineral products by this province equalled 52.9 per cent. of the mineral output of all the other provinces combined. In comparing our coal and coke production with that of the rest of Canada we show a total value of \$8,071,747.00, against the \$18,439,128.00 of the other provinces.

Considering the greater difficulties of transportation which we have to face and the greater expense of production on this coast, British Columbia well maintains her title of the Mineral Province.

The most notable addition to our visible mineral assets during the past two years has been the development of the vast coal beds near Stewart, the Ground Hog Mountain anthracite fields.

This deposit was discovered in 1893 by Mr. James McEvoy, B.Sc., formerly of the Geological Survey of Canada, but it is only during the past two years that the existence has been proved of a field far greater than was even at first suspected. In 1903-4 Mr. McEvoy staked sixteen square miles, and statutory assessment work has been done on that area each year since.

Subsequent stakings and discoveries proved that the field extended over an area 70 miles long and 30 miles wide, and it is estimated that this area of over 2,100 square miles does not mark the full limits of the deposits.

The area of the Pennsylvania anthracite fields, by the way, is 480 square miles, with an annual output of nearly 84,000,000 tons. If, therefore, the Ground Hog anthracite proves of a high quality, it does not need any argument to demonstrate the possibilities of Northern British Columbia as a coal producer.

A new coal field requires time for development before the quality of the coal can be finally determined. The analyses that have been made up to the present are very high in ash, and samples from different parts vary widely in ash and fixed carbon. Practical mining men know that such discrepancies may be expected at the present time because the samples are none of them free from surface impurities and excess of earthy matter. The analyses from the main coal body will be awaited with interest and all the indications are that they will compare favorably both with Welsh and Pennsylvania anthracite.

WORKINGS ON A SEAM OF ANTHRACITE BY THE BRITISH COLUMBIA ANTHRACITE COAL SYNDICATE, CONDUCTED UNDER THE MANAGEMENT OF MR. R. C. CAMPBELL JOHNSON

Anthracite is the most highly mineralized form of coal, giving off little or no smoke. It is very difficult to ignite, but when burning gives off intense heat. This class of coal contains a very high percentage of carbon, the best qualities containing from 90 to 95 per cent.

Analyses of fifteen samples of the Ground Hog anthracite have been brought to the notice of the writer, and they gave an average of 71.73 per cent. of carbon. These samples were taken from twelve different seams and ranged from 56.53 per cent. to 86.74 per cent. in carbon.

A characteristic sample of Welsh anthracite gave 95.53 per cent. of carbon and a Pennsylvania sample 80.8 per cent. to 86.4 per cent. of carbon. Our readers may draw their own conclusions from these figures. Remember, the samples from Ground Hog Mountain were not free from surface impurities or excess of earthy matter.

Having established the existence of this vast coal field, the matter of transportation must be considered. At the present time the most accessible route is by way of Hazelton, which has been for years at the head of navigation on the Skeena River. From Hazelton the trail into the gold field is about 140 miles long.

The map which we publish illustrates the important relation which the port of Stewart bears to this coal field. It is the

nearest tidewater port, and the Stewart route is the one most favorably considered by people who know the country. The following remarks upon the Stewart route by Mr. Fleet Robinson, Provincial Mineralogist, may be quoted:

"A third route, and the shortest to tidewater, estimated at about 125 miles, would leave the coal fields through Courier Pass on to the Naas, which river would be followed down for about seventy-five miles, where a tributary flowing from the west would be followed up to its source, which is in a pass on the divide between this fork of the Naas and the headwaters of Bear River, the stream flowing into the upper end of the Portland Canal at the town of Stewart.

"At the Stewart end of this route Sir D. D. Mann has already constructed a line of railroad up the valley of the Bear River for a distance of about fifteen miles, and has constructed a pier capable of receiving ocean vessels.

"The harbor at Stewart presents some difficulties to the establishment of extensive dockage facilities, but these are not unsurmountable; Portland Canal provides a good navigable waterway, but its inner end, at Stewart, is a long distance from the ocean, about seventy-five miles, and these facts somewhat offset the advantage of the shorter railroad route."

MEZIADEN LAKE, WHICH LIES BETWEEN STEWART AND THE GROUND HOG MOUNTAIN COAL FIELD

The land for miles around this lake has been staked for agricultural purposes. There are plenty of trout here. At the head of this lake Sir Donald Mann has staked a very large waterpower, for the purpose, it is believed, of electrifying his road from Stewart to the Lake Meziaden, a distance of thirty-five miles. This power would also be ample for supplying the mining operations in the Bear River Valley.

The fact that some time must necessarily elapse before the development of the coal field reaches a point when the output must be handled allows of consideration of the best route for railways or roads to take into the coal basin. Not only the Canadian Northern Railway but the Grand Trunk Pacific Railway is laying steel in the north, and the people of Stewart are fully alive to their responsibilities. They are actively engaged in securing the construction of roads and trails into the Ground Hog district, and are also seeing that the harbor at Stewart is made ready for this coming trade.

The following is an extract from a report of a meeting of the Stewart Citizens' Association:

"The following resolution was then brought in by P. F. Godenrath:

That at a public meeting of the Stewart Citizens' Association we urge upon the executive committee to use every effort in its power to secure additional financial support from the provincial government to guarantee the completion of the proposed Stewart-Ground Hog trail this season. The said trail to follow the proposed route of the government engineer, being a continuation of the present trail from Meziadin Lake to a point between Cabins Six and Seven on the Yukon telegraph trail.

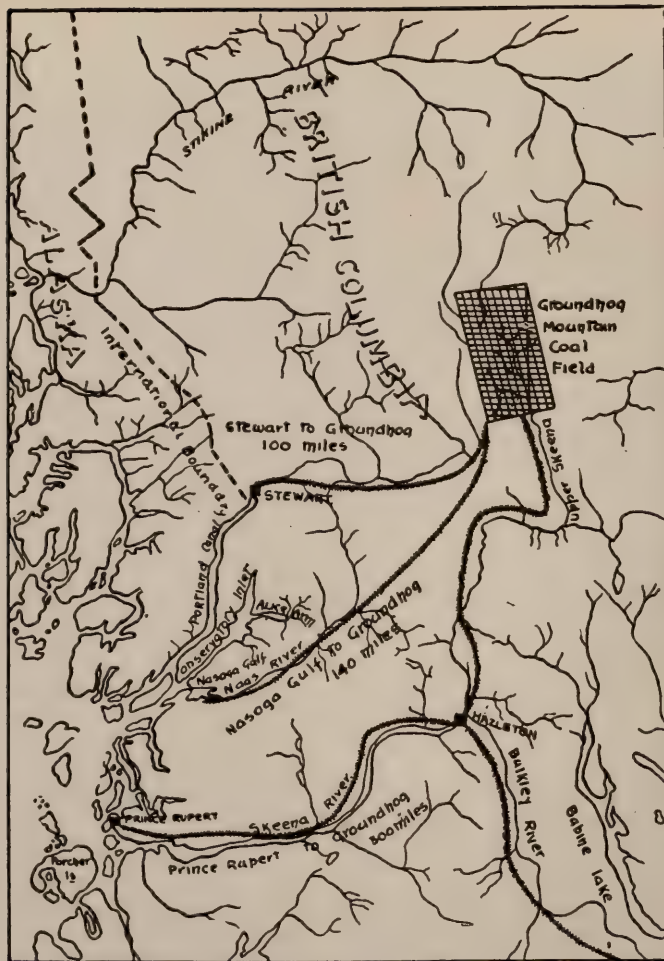

"The mover pointed out that if the business interests of the town were to receive

any benefit next season from the development of the Ground Hog coal fields it was imperative that steps should be taken at once to secure from the public works department an additional appropriation to carry forward the pack trail now nearing completion to Meziadin Lake, through to a point on the government telegraph trail between Cabins Six and Seven. He pointed out that as a result of Engineer Gillespie's survey an easy grade could be secured and between fifty-five and sixty miles would tap the telegraph trail, which would give direct connection with the different trails in the Ground Hog coal basin. He had been assured that there was practically no rock work after leaving Meziadin Lake and that it was mainly an open country all the way. The proposed route would follow up the Hanna River a distance of ten miles, then cross to Cottonwood and direct east to a point between Cabins Six and Seven. Only one bridge of any length was needed, and he felt satisfied that with a reasonably large crew, if the appropriation was secured immediately, that the trail could be built to the telegraph line before winter. In this event the merchants would reap a big share of the business next season. If, however, the trail was not built this year there could be no hope of any business until late next fall. Once the trail was put through it was up to the merchants and packers to meet any competition with Hazelton."

The following are reports from well-known geologists and engineers. They are expert and unbiased opinions on the largest coal area in British Columbia.

In a preliminary report of the Geological Survey of Canada issued at the end of the year, G. S. Malloch, of the staff of the Survey, who spent the summer of 1911 in the Skeena district, stated of the Ground Hog Mountain field:

"The coal measures as far as known have a northward extent of at least 70 miles, and a width at the southern end of 30 miles. The sediments have a thickness of upwards of 3,000 feet, but contain coal in commercial quantities near the top and bottom only, though there are a few thin seams in the intermediate beds. The upper horizon contains seven seams, with thicknesses varying from 2 ft. 6 in., and so far as is known, is limited to an area of 20 square miles. The lower horizon contains at least three seams

LOCALITY MAP GROUNDHOG M^{tn} COAL FIELD B.C.
PROJECTED RAILWAYS

4 ft. to 6 ft. thick, and extends over most of the area occupied by the coal measures. The coal is anthracite in character. Some of the seams are high in ash, but from one of them some excellent analyses have been obtained. The basin is faulted considerably, and there are numerous local flexures associated with the faults. The development of a coal field of this character near the Pacific Coast would be of great importance to British Columbia."

J. E. McEvoy, formerly of the staff of the Geological Survey, and for some years geologist to the Crow's Nest Pass Coal Company, Ltd., says, in his report dated November 21, 1911, to the British Columbia Anthracite Syndicate, of Quebec: "I have no doubt, however, that a large market can be found for this coal at good prices.

The domestic market will be the most important at first, and, in this connection, as the coal is practically smokeless, and as it will not make dust and dirt all over the house in the way the soft coals of the West invariably do, it will be self-advertising. . . . The writer visited the property three times during the months of August and September this year. Prospecting work was going on under the direction of Mr. Campbell-Johnston, and was still carried on for three or four weeks after the last visit.

"The coal seams were exposed by the removal of the covering of clay and gravel, and only surface coal could be seen. At the time of the last visit, slopes had been started, but they were only down three or four feet, so that the coal was still very dirty with clay introduced by surface waters. . . .

TYPICAL AGRICULTURAL LAND NEAR GROUND HOG MOUNTAIN. THOUSANDS OF ACRES ARE ONLY WAITING FOR THE PLOUGH

"The coal has crystalline fracture, is very bright and hard, without any pronounced jointage planes. It is not at all crushed or slickensided, and as a consequence it will be mined in strong, hard lumps, and will make little slack. It burns very well in a blacksmith forge, giving an intense heat. So great is the heat, in fact, that if a steel implement is left a few minutes too long in the fire the steel will be melted. The flame is almost colorless and smokeless."

G. F. Monckton, of Duncan, Vancouver Island, who was associated with Mr. Campbell-Johnston last summer in the carrying out of development work, has also

made a report on the holdings of the B. C. Anthracite Syndicate. He says: "The strata present a regularity which is rarely found in association with anthracite beds outside of South Wales and Pennsylvania. On account of the rise in the strata to the northeast, as shown in the sections, it will be possible to work an area on this property of approximately twelve square miles without machinery by the simple expedient of driving tunnels into a mountain a little above the level of the Skeena, so as to intersect the Benoit and other seams immediately below it in turn, and each of these seams can then be worked to the rise as the management may desire. This would mean a saving in capital of about \$600,000 as compared with working the property on the west side of the Skeena by shafts, and would result in additional economy in the actual cost of mining."

R. Campbell-Johnston, M.E., of Vancouver, has done more than anyone else to draw public attention to the prospective importance of the Ground Hog Mountain coal field, and while the existence of coal there has been recognized for the past eight to ten years, it is only within the past six months that the extent of the area has been realized. Hitherto the knowledge of anthracite coal in the West has been limited

THIS PHOTOGRAPH SHOWS THE OPEN CHARACTER OF THE RICH FARM LAND ALONG THE ROUTE FROM STEWART TO THE NEWLY DISCOVERED COAL BEDS AT GROUND HOG MOUNTAIN. AS MAY BE SEEN, THERE IS VERY LITTLE CLEARING NECESSARY

A VIEW OF THE TOWN OF STEWART TAKEN IN THE WINTERTIME FROM THE END OF THE GOVERNMENT WHARF. THIS GIVES AN EXCELLENT IDEA OF THE HARBOR AND PROVES THE ABSENCE OF ICE DURING THE WINTER MONTHS. IT ALSO SHOWS THE LEVEL CHARACTER OF THE TOWNSITE

to the Cascade area in Alberta and the Palliser area in British Columbia, covering forty square miles, and having an estimated content, according to Dowling, of 1,260,000,000 tons of semi-anthracite, anthracitic, and anthracite coals. The largest coal area in British Columbia was hitherto stated by Dowling to be the Nanaimo field, with 350 square miles of bituminous coal, estimated at 1,355,000,000 tons; while the most productive field, though of smaller area, has been stated as Elk River, with 230 square miles, carrying 22,600,000 tons of bituminous coal. Now the Ground Hog Mountain field places all the hitherto known coal areas of British Columbia in the shade with an area six times greater than the Nanaimo field, hitherto recognized as the largest of our coal areas. The discovery of the Ground Hog Mountain field is another testimony to the geological work in this province of Dr. Dawson. In looking over a paper which he contributed in 1881 to a British geological magazine, we find that so long ago as that he suggested "the probable occurrence of valuable coal seams on the Skeena River," but the extent of the discovery outlined in this article must overshadow his most sanguine estimates.

Referring to the new field during the last session of the Legislature, Hon. Richard McBride, Minister of Mines, said: "And

it would seem from the development of the past year as though we had only touched the margin of our wonderful coal deposits. The year's developments include new and great coal fields in East Kootenay, other new and important deposits in the Similkameen, and last, but probably the greatest, is the determination of what promises to be the greatest anthracite or semi-anthracite field west of Pennsylvania, on the headwaters of the Skeena River. This field is only partly developed as yet, and if but a fraction of the present promise is fulfilled it is bound to have a wonderfully stimulative effect upon the future of the province. The coal mines of Great Britain gave it its position as the manufacturing centre of the world, and our coal fields will unquestionably serve as a strong magnet to draw the manufacturing interests of the Pacific to our shores. Coal is a breeder of industries and its value to the country does not by any means end with its disposal by the mining companies."

The engineers who have examined the field have recognized the importance of this question of transportation, and all have given it their attention. Mr. Malloch and Mr. McEvoy were probably in a position to give the most disinterested opinion of the transportation problem. They selected the town of Stewart, at the head of Portland

Canal, as the best ocean outlet for this field.

Mr. Malloch said: "In order to obtain a market for coal from this field many miles of railway will have to be built. The most direct route to the sea would reach it at the town of Stewart, situated at the head of Portland Canal."

The fact that Sir Donald Mann has secured control of over 500 square miles of coal land in the Ground Hog basin is a pledge of the active interest of the C. N. R. for providing railway facilities and opening up the coal field as soon as possible.

In order to prevent any misunderstanding concerning the present railway developments at Stewart, I may point out that the line is the personal property of Sir Donald Mann, and not of the Canadian Northern Railway Company.

This article would not be complete without some mention of the character of the country between Stewart and the Ground-hog coal beds. As may be seen from the photographs, which illustrate the article, the country is open and ready for the

plough. In some places it is covered with light alder, which presents no difficulty in clearing.

This country is known to be one of the largest areas of available farm land in British Columbia, and only needs transportation to open it up for settlement. The combination of coal-mining and agriculture will make this portion of the province one of the busiest and most productive areas in the future.

At the present time the weather is ideal for making a trip to Stewart by the excellent service of boats run by the Grand Trunk Pacific. This trip is now made by a large number of tourists from Vancouver, Victoria and Seattle. The whole journey from Vancouver to Stewart and back is about 1,500 miles, and takes a week. The vessel is all the time on land-locked waters, so that the discomforts which often accompany an ocean trip are absent. The scenery from Prince Rupert to Stewart, up the Portland Canal, is unrivalled on this coast.

The September Number of the
British Columbia Magazine

will contain a full report of the paper entitled

"Imperial Preference for British Investments"

*which was read by the Editor, F. B. VROOMAN, B.Sc., Ph.D., F.R.G.S.,
 before the London Chamber of Commerce, on July 30, 1912.*

"One of the most important contributions ever made to the increasing knowledge about Canada amongst British Investors."

The Governor-General

H. R. H. THE DUKE OF CONNAUGHT IN THE ROBES OF A KNIGHT OF THE GARTER

THE Duke is soon to visit British Columbia, where he will find a warm welcome awaiting him. He has associations in our minds which bring him very near our hearts. He is a son of Queen Victoria, brother of King Edward, and uncle of King George. In 1870 the Duke saw active service in Canada during the Red River Expedition and the Fenian Raid. He is Honorary Colonel of the Sixth "Duke of Connaught's Own Rifles," Vancouver. He is also the Grand Master of Freemasons in Great Britain, and a Mohawk Indian Chief. He is sixty-two years old.

Victoria Harbors

VICTORIA harbors may properly be comprised under the category of the Outer Harbor, the Inner Harbor and Esquimalt Harbor. While the latter is not included in the municipality, it will be in the not distant future, and is certain to be of vast importance in the harbor question as affecting the city of Victoria.

Recent official statements concerning Victoria's harbors emanating from the Department of Marine and Fisheries suggest a "fish story" of ample proportions. These naive errors have been fathered apparently on the principle of "where ignorance is bliss 'twere folly to be wise." While it may not always be hoped that government statistics can be made fairly reliable, it may not be too vain a desire to wish that hereafter, at least as to the harbors of Victoria, they may not be concocted in a manner so elaborately inaccurate.

Victoria has harbors, and is having tremendously important improvements added to these harbors. Victoria is having an additional Outer Harbor constructed on which the initial outlay will be close to one million and a half dollars. This will provide for 9,600 feet of berthing for ocean-going steamers, and will be of the latest and finest equipment in the way of machinery, warehouses and docks. It is being built on the location selected by the Dominion Government's expert, Mr. Louis Coste, and other expert engineers. When completed, it will be a magnificent ocean harbor, with a straight, clear outlet to the Pacific.

The preliminary expenditure will indicate the magnitude of the undertaking. It will cost much more than this eventually to give Victoria sufficient shipping facilities, but this sum will give the city, in addition to its present Outer Harbor, a spacious and strictly modern harbor, thoroughly sheltered, and affording berthing for the heavily increasing ocean traffic which is coming to her wharves. In every respect this harbor will equal the finest harbors on the Coast, and will probably measure up to the

necessities of the Capital City until her population reaches the 200,000 mark. Four huge concrete piers, with adequate warehouses, will be built out into the Straits of Juan de Fuca, each warehouse equipped with up-to-date cargo-handling facilities, and a railway slip constructed to enable car-ferries to load and disembark their trains at the wharves.

A stone breakwater, with concrete blocks topped by a concrete wall 2,500 feet long, will reach west into the straits from Ogden Point, with a concrete pier 1,100 feet in length on the inner side. Four additional piers of 800, 730, 700 and 500 feet respectively will be constructed, and there will be room for thirty of the largest vessels afloat when the docks are finished. Seven warehouses in all, each of ample proportions, and all strictly modernized as to freight-handling, will be built, and a grain elevator is another addition planned for the direct handling of Western Canadian wheat. Railway connection with the present railways in Victoria and those now building into the city will be provided for, with or without bridge connection as circumstances require.

The Outer Harbor contains nearly 300 acres of water, varying in depth from thirty to eighty feet. Vessels lie in perfect safety in all weathers at the present docks, but the breakwater now being arranged for will not only shelter the additional piers provided for, but also protect the entrance to the Inner Harbor, thereby immensely benefitting the coasting vessels using this harbor.

There are thirty vessels at present which call at Victoria in the transpacific trade. Over 2,500 ships berthed at the Outer Harbor in 1911, with a tonnage of over 3,000,000 tons. The number of vessels has doubled in the past three years. The amount of freight and passenger traffic has likewise doubled in the same time. With the completion of this Outer Harbor it will not only be the finest ocean harbor on the North Pacific coast, but it will be the most accessible to deep sea water, and the

OUTER HARBOR, VICTORIA, B. C.—BLUE FUNNEL LINER "TITAN" AND THREE-MASTED SHIP "SLIEVE ROE"

least troubled by fogs of any North Pacific harbor. Only Esquimault Harbor can possibly compete with it for safety, comparative immunity from fog, and nearness to the Pacific, with an open and unimpeded run to ocean channels.

Victoria's Inner Harbor has a long and interesting history. Here the Hudson's Bay Company built in early days, and from here commerce has steadily and persistently been built up until today considerably over one hundred vessels of all kinds and classes use it regularly; while through the energetic efforts of the daily press of Victoria, the Victoria Board of Trade, the influential and active Inner Harbor Association and its able secretary, Mr. Thomas C. Sorby, a steady improvement has been carried on with regard to its facilities.

The improvements for this Inner Harbor provided for in Mr. Coste's plan include the dredging to a uniform depth of twenty feet, the removal of certain rock obstructions, and other changes which are a prime necessity not only to the city of Victoria itself but to the Island of Vancouver, the Province of British Columbia, to the Dominion, and the Empire.

Mr. Coste, in making his recommendations to the government, uses the following significant language, in part, in his report:

"The geographical position of that port

(Victoria), at the southeast end of the Island of Vancouver, almost at the point of junction between the Strait of Georgia and the Strait of Juan de Fuca, gives it a commanding advantage over any other port in the province in matter of trade and commerce with the ports of the United States on the Pacific coast, and the fact that it is the nearest Canadian port to the Panama Canal is bound to very materially increase its tonnage when the great canal is completed."

This is the testimony of a disinterested and expert witness, sent to Victoria by the Dominion Government to determine the question of harbor improvements. His language could not be more definite, positive, or illuminating.

The gist of it is, the geographical position of Victoria gives it a commanding advantage over any other port in the province—bound to increase its tonnage materially when the Panama Canal is completed.

Nothing in the way of human development can change geographical position. Nearness to the Pacific, absence of fogs to a very great extent, and straight and safe passage to the sea are guaranteed Victoria by nature.

VICTORIA, B. C., CANADA, INNER HARBOR, SHOWING DOCKS OF CANADIAN PACIFIC RAILWAY AND GRAND TRUNK PACIFIC RAILWAY

OUTER HARBOR, VICTORIA, B. C.—OCEAN FREIGHTERS AND SCHOONERS LOADING WHALE OIL

It is these advantages which settle positively Victoria's commanding advantage over any other port in the province, not only as to traffic with the United States, as Mr. Coste says, but as to all ports and all countries.

Esquimault Harbor, last but by no means least in Victoria's list of harbors, has been said by engineers to be the second best harbor in the world, the harbor at Sydney, Australia, being placed first. Probably this same opinion has been voiced by other experts as to various harbors. At any rate, Esquimault Harbor is a really superb harbor, land-locked, deep, easy and safe access to and from the Straits of Juan de Fuca, and absolutely certain to be of the greatest possible importance both from the standpoint of commerce and from that of strategic importance in the event of war. It contains a dry-dock at present which provides docking for vessels needing repairing, but not of proportions to float the largest sea-going ships; but there is no doubt that dry-docks will presently be erected to provide for any vessels afloat. It has ship-yards which are even now turning out ships of large size, and which bid fair in time to build the largest craft. It

is the site of the former naval base, and the home harbor of H. M. C. S. Rainbow, the training vessel stationed on the Pacific coast.

Dry-docks of the greatest magnitude, and ship-yards capable of turning out vessels equal to those of the Clyde and Shannon will be among the future developments of this great harbor, together with manufacturing enterprises of world-wide importance.

Victoria has harbors, and a harbor policy. Its harbors have been herein described, although inadequately and briefly. Its harbor policy is one of steady improvement and perceptible progress. Its claims have been recognized, not merely by word of mouth, but by appropriations. Both faith and works have characterized the Dominion Government's appreciation of the Capital City's needs. The Panama Canal will add very much to the requirements of Victoria's harbors, but outside and apart from such additional needs, the volume of traffic, both ocean-going and coast-wise, both in the matter of freight and passengers, is increasing year by year in steady proportions, and makes the future of Victoria as a port of the first character an assured and provable fact.

THE CHALLENGE OF THE MOUNTAINS

THE GREAT GLACIER, GLACIER, BRITISH COLUMBIA. IT IS THE CENTRE OF A GROUP OF GLACIERS COVERING AN AREA OF MORE THAN 157 SQUARE MILES. LIKE ALL GREAT GLACIERS IN THE NORTHERN HEMISPHERE IT IS GRADUALLY RECEDING. THE ILLECILLEWAET GLACIER GOES BACK 35 FEET EVERY YEAR

ONE of the first remarks made by travellers arriving at the coast of British Columbia by way of the Canadian Pacific Railway, through the Rockies, is that they have never seen such magnificent scenery before in their lives. These travellers are many of them familiar with all the famous beauty spots in the United States and Europe. Neither the Alps of Switzerland or the rugged beauties of Yellowstone Park can equal the majesty and superb beauty of the Rocky Mountains in British Columbia.

By the courtesy of the Canadian Pacific Railway we are able to give our readers some idea of the great scenic treasure-house

of this province which is attracting tourists from all parts of the globe.

A well-known American lady speaks with enthusiasm of what she calls the Switzerland of the American continent. She says:

"Europe has its Switzerland, famous throughout the world for the splendor and magnificence of its mountain scenery, which has lured thousands of travellers because of its variety and charm, as well as because of its accessibility. Its scenery is unchangingly beautiful, and the Alpine heights retain a ceaseless fascination for the mountaineer. Yet we turn with wonder and admiration to our own Switzerland. The paradise of our continent lies among the rugged Rocky Mountains of Canada. For miles and miles

THE CHALLENGE OF THE MOUNTAINS

LOOKOUT POINT, FROM THE CAVES OF NAKIMU. THESE GREAT CAVES ARE SIX MILES FROM GLACIER AND ARE ABOVE THE SNOW LINE. THEIR WALLS SPARKLE WITH QUARTZ CRYSTALS. THE SCENERY FROM THE TRAIL BY WHICH THE CAVES ARE REACHED IS BEYOND DESCRIPTION

the train glides at their base, showing new wonders at every turn—the wonderful and fascinating glaciers; the number and enormity of the majestic ranges; the sharp precipices; the beautiful, snowy peaks; the deep green forests; the lovely clear lakes and peaceful valleys. The Canadian Government has set aside over 6,000 square miles of this region as a national park, and the Canadian Pacific Railway Company has built a number of hotels and chalets, each rivaling the other for comfort, service and fine location. The average traveller, however, spends too little time in this attractive country, as a rule only stopping off for a day or so between trains; while a stay of

two or three days should be made at each of the resorts in order to fully note the ever-varying changes of light and shadow, the glorious sunsets, and the rare experience of visiting the ice caves in the glaciers, in midsummer.”—Miss Ilma Schadee, in the Springfield “Republican.”

The New York “Tribune” says: “It is not generally known that within four days’ journey of New York City there are waiting for the sight-seer and scientific investigator some of the grandest and most impressive glacial streams in the world. Nothing in Switzerland is to be found more beautiful than the glaciers of the Canadian Rockies and Selkirks, and one of the chief

THE CHALLENGE OF THE MOUNTAINS

WHILE THE KOOTENAY DISTRICT OF BRITISH COLUMBIA HAS NOT THE SCENIC GRANDEUR OF THE ROCKIES IT HAS ANOTHER BEAUTY OF VALLEYS, LAKES AND MOUNTAINS WHICH MAKES IT A SPOT OF VARIED ATTRACTIVENESS. THIS CAVE IS ONE OF THE SCENIC FEATURES OF THE DISTRICT

attractions of the trip is the fact that one may journey there and back in civilized luxury, and while enjoying the scenes, at the very noses of the wonderful glaciers themselves, be comfortable and remain in close touch with the world."

The Canadian Pacific Railway line, above all others, merits the much-used description, "The scenic line of the world." From Calgary to Vancouver, a distance of six hundred and forty-two miles, the beauty and grandeur of the scenery is continuous. That "there is not a dull or uninteresting minute all the way" is the opinion of all who have made the journey.

Unfortunately, the average tourist is all too prone to stop over only between trains and thus catch but a hurried glance of these glorious peaks, which is regrettable, inasmuch as frequently the greater beauty is missed entirely, though thousands claim that travelling through these mountains without leaving the train has been the most enjoyable event and the greatest scenic treat of their lives.

In the mountain ranges, lakes and valleys of this district are not only the scenic beauties and wonders of Switzerland duplicated on a much wider and grander scale, but there is added a diversity of climate

THE CHALLENGE OF THE MOUNTAINS

MOUNT STEPHEN, ONE OF THE MONARCHS OF THE ROCKIES. AT ITS FOOT IS FIELD, A CENTRAL SPOT FOR TOURISTS WHO WISH TO MAKE EXCURSIONS AMONGST THE SCENIC SPLENDORS OF THE MOUNTAINS.

Prince Rupert

THE PACIFIC PORT OF THE GRAND TRUNK PACIFIC RAILWAY

PRINCE Rupert is the new city now being built on the northern British Columbia Coast. There have been acquired in the interest of the railway company twenty-four thousand acres of land at Prince Rupert and vicinity for the purpose of the townsite and the development of the port, a one-quarter interest of which belongs to the province of British Columbia, which is therefore jointly interested with the railway company in the development of this new seaport.

The first subdivision of the townsite covers an area of about two thousand acres.

Prince Rupert is situated 550 miles north of Vancouver and forty miles south of the Alaskan Boundary. It is in the same latitude as London, and has a climate the mean temperature of which is about the same as that of the metropolis of the British Isles.

The selection of the Pacific Coast terminus was one of the most important tasks with which the builders of this national highway had to do. The entire north coast was searched, and every harbor sounded before a final decision was made. The very satisfactory result is that the future metropolis of the north coast will look out upon a harbor that is all that could be hoped for. Although practically landlocked, it has a mile-wide channel, and is sufficient in size to shelter all the ships that are likely to come to it, great as are the possibilities of this new port.

Because Prince Rupert is at the end of the line, and the nearest port to Japan and the East; because it is on the shortest line from Liverpool to Yokohama, the shortest route around the world, it is bound to lie on the All Red Route. The city was planned in advance of any building, and nothing was overlooked which would add to the beauty and symmetry of this city to be.

Under the usual conditions of Crown

Grants one-quarter of all the land reverts to the province, as also one-quarter of the waterfront after the townsite has been laid out.

Probably never before has there been so much money and time expended in the planning of a new city as has been devoted to the preliminary work at Prince Rupert, not only by the railway company, but by the Dominion and Provincial Governments as well. This work was commenced in May, 1906, when the company's staff of engineers made a landing and clearing for the location of their camp preparatory to making the preliminary survey, after which time the work of surveying and clearing was carried on continuously until a complete topographical survey was made of all lands comprised in the townsite covering an area of 2,000 acres, and great care was taken with this work on account of the important bearing it would have upon the final laying out of streets, etc.

The Dominion Government Hydrographic Survey has made a complete survey of Prince Rupert Harbor and approaches, which shows that the entire harbor from the entrance to the extreme end of the upper harbor, a distance of 14 miles, is entirely free from rocks or obstructions of any kind and of a sufficient depth to afford good anchorage.

The entrance is perfectly straight, 2,000 feet in width at the narrowest part with a minimum depth of 36 feet at low tide, and for a width of 1,500 feet the minimum depth is 60 feet. The British Survey Ship "Egeria," which made the survey of the outer approaches to the harbor, reported a splendid entrance through Brown's Passage.

Messrs. Brett & Hall, of Boston, Mass., were secured by the railway company to lay out the townsite. They have provided a plan which is eminently satisfactory and will ensure a practical development while preserving for the future city splendid opportunities for parks, for municipal im-

GENERAL VIEW OF HARBOR AND TOWNSITE—PRINCE RUPERT

STEEL ON THE DOCKS AT PRINCE RUPERT FOR GRAND TRUNK PACIFIC CONSTRUCTION

provements, and for architectural embellishment. It is believed by many who have studied this plan that Prince Rupert will be one of the most beautiful cities on the American Continent.

Two hundred thousand dollars were appropriated by the Provincial Government of British Columbia for preliminary improvements, which amount was expended in the construction of plank sidewalks and roadways, sewers and water mains, before the opening of the townsite, so that, unlike most new towns, ample provision was made in advance for the sanitary welfare and comfort of a population of at least ten thousand people, as well as providing other accommodations which would be required until the population should have sufficiently increased to warrant the construction of extensions of these facilities.

Upon the completion of the Grand Trunk Pacific Railway, the fishing industry at Prince Rupert and vicinity, which is now in its infancy, will be one of the greatest in the world, and will furnish employment, not only to the railway company and its employees, but to hundreds of fishermen and laborers who must necessarily establish their homes at Prince Rupert. At the present time, a large company is arranging to engage in this industry, with headquarters at Prince Rupert.

The canned salmon industry ranks among the leading industries of this country, but, in the last few years, cold-storage plants have been installed, with excellent results, and, by the time the Grand Trunk Pacific Railway is completed, refrigerators will hold and refrigerator cars will carry and deliver this, the king of fish foods, to the tables of the people of the United States and Canada in the East as well as the West, and, in fact, the markets of the world.

A license has been granted to establish a whaling station within a few miles of Prince Rupert, which will be an important industry and feeder to the new city, as it has been found that more whales abound and have been taken in the waters off the coast of British Columbia, during the time the whaling stations have been in operation, than in any other waters of the world. In fact, during the winter months, whales abound in the waters of Prince Rupert harbor; these, with all other fish industries, including cod, herring, and oolachan, now only in their infancy, are capable of immense growth and advancement and will be a great factor, not only in the building up of this city, but as a source of lucrative employment to the fishermen, merchants, steamboat owners, laborers, and others who will purchase, rent, and have their homes

VIEW OF PRINCE RUPERT FROM OPPOSITE SHORE

PRINCE RUPERT INN

in Prince Rupert. The value of these fisheries lying at the gateway of this, one of the finest harbors in the world, cannot be estimated.

The timber industry of this part of the country is also in its infancy, and, within a radius of one hundred miles, much good spruce, hemlock, and cedar are to be found. At the present time, a large steam saw-mill, costing \$200,000, located at Prince Rupert, and a water-power mill some few miles distant, are supplying the local markets at most reasonable prices. It is safe to say that the forests within this radius will produce timber enough to supply twenty-five mills with all the timber they can cut and market for the next twenty years.

Unless one is conversant with the development of the Pacific Coast, has seen its seaports grow, particularly Victoria, Vancouver, Tacoma, Seattle, Portland, San Francisco, and Los Angeles, to say nothing of some of the smaller ones, such as Bellingham, Everett, Aberdeen, Astoria, San Pedro, and San Diego, and has watched the commerce and shipping expand year by year, until the figures of each of the larger ones are simply astounding, one cannot fully realize the possibilities and probabilities of Prince Rupert, which has an em-

pire in itself tributary to it. What were Vancouver, Seattle, Tacoma, Portland, and Los Angeles fifteen years ago? Some of them were hardly on the map. Look at them today—each a splendid example of what energy, brains, and money can and will do in the Golden West, and who can predict what Prince Rupert will be in the next fifteen or twenty years, or even in five or ten years?

At the present time, nearly every line of business is represented, and mention can be made of only a few of them. A wholesale dry-goods house has been built and doing business for the past eighteen months; there are three daily and weekly newspapers—"The Optimist," "The Empire," and "The Journal." There are a number of grocery stores and several carrying stocks of general merchandise, two hardware, two gents' furnishings, one or two furniture, and numerous fruit and cigar stores. A Board of Trade has been organized, and branches of the Canadian Bank of Commerce and the Union Bank of Canada have also been opened. A wholesale and retail meat and provision store has been doing business for over a year. There are two good hotels, the "Prince Rupert Inn" and "Annex," which belong to the Grand

Trunk Pacific Railway Company, with first-class accommodations, in addition to which there are numerous other hotels, lodging-houses, and restaurants.

The Provincial Government is making Prince Rupert its headquarters for the northern part of the province, and substantial buildings for its officers, court house and jail have been constructed. The Dominion Government is also making preparations for the erection of permanent and substantial Custom House and Post Office buildings and has under construction at the present time a Quarantine Station at the entrance to the harbor as well as a Wireless Telegraph Station. A large and commodious public school building has just been completed where competent teachers are in charge.

There is an abundant supply of fresh water from mountain streams and lakes having a sufficient flow for a population of more than one hundred thousand people.

Prince Rupert is also on the route of the celebrated "Sail up the Sound" which, for wild grandeur, excels almost anything to be found in the world from the deck of a seagoing ship, while the trains of the Grand Trunk Pacific Railway will traverse some of the finest scenery to be found on the American Continent. From the wooded lake-lands of Quebec and Ontario, across the wide and fertile fields of the Prairie provinces, by the banks of the mighty rivers of the North, through Yellowhead Pass, through deep, dark canyons, where in mid-summer, from beneath the north windows of a west-bound train, will come the sweet fragrance of wild roses, while from the south windows, the traveler can look out upon a glinting glacier whose cold shroud trails to the margin of the mountain stream, along the banks of which the trains will travel over this short cut across Canada. And this same train will take the traveler by the base of Mt. Robson, said to be the highest mountain in the Dominion.

And over these rails, and down to Prince Rupert, will flow the commerce of all that new West, bound for the East by the Western way, as surely as the waters of the Pacific slope flow into the Pacific Ocean; but this commercial water-shed will extend hundreds of miles further east than the natural water-shed extends. The mineral wealth of all that vast mountain region,

the forest products, the coal, the copper and iron ore of Northern British Columbia and the Yukon, as well as the food products of the Prairie provinces, and the fish and fur of the far North—in short, all the export wealth of that resourceful region, west-bound, must find its outlet to the sea at Prince Rupert.

Prince Rupert is surrounded by a country whose natural resources are more rich and varied than those of any other country known to the present generation. And her sphere is ever widening, her natural trade zone is daily being extended north and still further north.

It is but a little over half a century since a Congressional Commission, sitting in Chicago, declared that the State of Illinois marked the Northern limit of the profitable wheat growing area of this continent. In spite of this the little pink bread-berry spread north and west to Minnesota, the Dakotas, crawled up the Red River of the North, to Portage Plains, spread over Saskatchewan to Alberta where the miller came into competition with the flour of the Peace River, and where, not having heard of the Chicago Commission, men had been sowing and reaping for a generation or more.

Every traveler and explorer who goes into the far North comes out with new stories of that much maligned land until their song of praise swells into a sublime chorus, compelling us by the mere preponderance of evidence to listen and to learn.

Only the other day, before the Royal Geographical Society in London, Mr. A. Harrison told some startling stories of the Northwest. He had been in search of an Arctic continent but had traveled for the most part through a land of green fields and running brooks. The fields were unfenced and "far flung" to be sure, but wherever he found a Hudson's Bay Post, a mission, or the habitation of man, there he found vegetables "such as are grown in one's garden at home," wheat and barley, marsh grass on the moorlands, and bunch grass on the plateaus. He found much valuable timber and endless indications of coal and oil. He suggests a railway from Edmonton north to the Athabasca, another from Prince Rupert to Fort McMurray, and a third to the Peace River, which would

PRINCE RUPERT HARBOR—PRINCE RUPERT SITE ON OPPOSITE SHORE

open a waterway 600 miles to Great Slave Lake.

From Fort Providence to the (Arctic) Red River (Lat. 67 deg. 26 min., long. 134 deg. 4 min.), a distance of 900 miles, Mr. Harrison found the navigation exceedingly simple and the whole stretch of country thus irrigated, he found "full of vegetation." "It will, in my opinion," he said, "one day be settled."

Another feature in favor of Prince Rupert is the great saving of time affected by the northerly route. The distance from Liverpool to Yokohama by this route is 10,031 miles, as against 10,829 miles via New York and San Francisco. Moreover, ships sailing from Prince Rupert pass, with a few strokes from the landlocked harbor to the high seas and begin their journey across the Pacific 500 miles nearer the East than a ship would be sailing at the same time from another Pacific port.

As an illustration of the advantage in distance which will be realized via the Grand Trunk Pacific route, it has been estimated that a traveler from China, Japan or Alaska may board a passenger train on the Grand Trunk Pacific Railway at Prince Rupert and be in Winnipeg within a few hours of the time the steamer from which he disembarked could reach Vancouver. In addition to the shorter distance across the Pacific Ocean will be the much faster time that can be made by rail over the practically level grades of four-tenths of one per cent. the Grand Trunk Pacific has obtained through the mountains, which will enable trains to be moved at the rate of two miles for every one mile over the heavier grades of more than two per cent. on other railways.

Because it has been held back; because settlers were not suffered to rush in before there was need of settlement, to scuffle and scramble and squat in picturesque con-

fusion, Prince Rupert is building up rapidly. Unlike an oil-town or a mining camp, its stability, its future is, by reason of the railway, and the richness of the surrounding country, already assured.

The Grand Trunk Pacific Coast Steamship Company, Limited, placed in service in June, 1910, between Seattle, Victoria, Vancouver and Prince Rupert, the handsome new twin-screw steamships "Prince Rupert" and "Prince George," which were specially constructed for this service and are the finest and most luxurious steamships in the North Pacific service, containing all the latest improvements for the comfort of passengers. They provide a bi-weekly service between Prince Rupert and Puget Sound. There are also other lines of steamers between Prince Rupert and Vancouver so that there are almost daily sailings between these ports.

Prince Rupert has many advantages. It has a mild climate. It is new and attractive. It is to be a model city in every sense of the word. It guards what is said to be the finest natural harbor on the Coast, if not in the world. It is the terminal town of a trans-continental railway, which bids fair to surpass anything ever attempted in the way of railway construction on this continent, crossing from ocean to ocean without a single mile of mountain grade, or grade that can, by any stretch of imagination, be considered an obstacle to the economical operation of the road.

To this new port will come the ships of the Seven Seas. Ships of the east, laden with silk and rice, will soon be riding at anchor in this splendid harbor, to sail away laden with lumber; ships from the West with the wares of the West; ships from the shores of far-off continents trading through the new and picturesque port of Prince Rupert.

The Man Who "Saws Wood" for Canada

THE HONORABLE GEORGE EULAS FOSTER, Minister of Trade and Commerce in the Borden Cabinet, is one of the most interesting personalities in the Dominion. In the first place he is without doubt the orator of the House of Commons, and in the second place he knows just when to orate and what he is orating about. Before entering upon a political career he was a schoolmaster, and there are those who say that he still suggests the pedagogue by his manner, and mode of speaking. Since 1882, Mr. Foster has been a factor to be reckoned with in Canadian politics. He has been a minister in several administrations since he took office as Minister of Marine and Fisheries and Minister of Finance under Sir John Macdonald. His predecessor in the office of Minister of Trade and Commerce declared it a sinecure, but Mr. Foster has already demonstrated that it is an important department of the Dominion Government.

Better trade relations with the Mother-country, the West Indies, Australia and other parts of the Empire have become live issues since Mr. Foster took the matter in hand, and no Canadian, no matter what his political views may be, can begrudge him the right to be considered a valuable asset to this country.

Mr. Foster, unlike most successful politicians both here and south of the border, is very diffident about mixing with "the boys" in moments of relaxation. He does not "play when he is out of school," and he has been known to express regret that his temperament has created for him a reputation for "aloofness" which is more apparent than real. One well-known humorist, at least, has given him advice on the point, "George," he said, "trim your whiskers and get drunk now and then."

Taken in a Pickwickian sense this might prove the very solution that Mr. Foster is looking for. Mr. Foster will soon pass through this Province on his way to Australia, and when he comes it is hoped that he will spend some time in Vancouver, so that we can show him that a statesman who "saws wood" is appreciated by all good Canadians in the West.

Vancouver Cadets in Australia

WE herewith reproduce photographs of Sydney, the capital of New South Wales, showing the waterfront and harbor and a glimpse of the famous Botanical Gardens overlooking the finest harbor in the world. Sydney had a population of over 630,000 in 1910. New South Wales has a population of 1,700,000, and an area of 310,372 square miles. The area of British Columbia is 395,000 square miles, with a total population not much more than half that of Sydney. Every man and woman in New South Wales over twenty-one has a vote. Ninety-seven and one-half per cent. of the people are of British extraction. The climate resembles that of Southern France and Italy. In 1909 the industries of New South Wales produced \$294,780,000. In 1910 her overseas trade amounted to \$276,037,220, of which over \$160,000,000 were exports. In 1910 Canada bought \$384,330 worth from New South Wales and sent her five times as much. New South Wales was first settled in 1788. Gold was discovered in 1842. The Torrens system of land registration is in force. When a person dies intestate, owning land, it is divided amongst his next of kin instead of descending to his heir. Indigent persons over sixty-five who have resided in the state for twenty-five years continuously receive a state pension of \$2.50 a week. School children are allowed to travel free by rail to the nearest school. Sydney has four large graving docks, five floating docks and four patent slips. Twenty-four million passengers were carried by the Sydney harbor ferries in 1910.

The Smuggler's Curse

By ALFRED HUSTWICK

Drawings by Graham Hyde

Oh! the muse and the booze and the talk flow free,
So I'll sing you a song of the bounding sea.

(Yo-ho! for the bounding sea.)

I'll sing you the ballad of the smuggler's curse,
With a dipsey burden in every verse.

(Yo-ho! for the smuggler's curse.)

Now Marlinspike Dave was a smuggler brave,
And he was the skipper of the "Ocean Wave."

(Yo-ho! and a bucket of suds.)

A better sailor never trod poop

Of a finer, faster or stauncher sloop.

(Yo-ho! and a bucket of suds.)

Marlinspike Dave, with an angry frown,
On the poop of the sloop paced up and down.

(Yo-ho! and a bucket of suds.)

The breeze was light and he wished for a gale,
For a strange ship showed on the weather rail.

(Yo-ho! and a bucket of suds.)

It was plain to him that the sloop was chased,
And he cursed his luck as the poop he paced.

(Yo-ho! and a bucket of suds.)

He cursed at the sky and the bounding sea,

And he cursed at the whole ship's company.

(Yo-ho! and a bucket of suds.)

For cursing to Dave didn't seem a vice,
And he never employed the same words twice.

(Yo-ho! and a bucket of suds.)

He strove of the practice an art to make,

And he cursed things chiefly for cursing's sake.

(Yo-ho! and a bucket of suds.)

He checked for a second his angry stride,
And he kicked the ship's cat over the side.
(Yo-ho! and a bucket of suds.)
He cursed at the mate as he turned again,
And he cursed each link in the anchor chain.
(Yo-ho! and a bucket of suds.)

He cursed at the rigging, he cursed the sails,
He cursed at the decks and he cursed the rails.
(Yo-ho! and a bucket of suds.)
He cursed at the cutter which chased him, and
He cursed at his cargo of contraband.
(Yo-ho! and a bucket of suds.)

He cursed them in German and Japanese,
In Arabic, English and Portuguese.
(Yo-ho! and a bucket of suds.)
He cursed in a dozen different tongues,
Till his breath gave out, then he cursed his lungs.
(Yo-ho! and a bucket of suds.)

Oh! faster and faster his curses flew
Till the atmosphere turned to Prussian blue
(Yo-ho! and a bucket of suds.)
And a great, thick wall of profanity
Rolled out, like a fog, o'er the bounding sea.
(Yo-ho! and a bucket of suds.)

When his voice was gone, in the alphabet
Of the deaf and dumb he was cursing yet.
(Yo-ho! and a bucket of suds.)
Till a mist enveloped the other ship
And the "Ocean Wave" gave her the slip.
(Yo-ho! and a bucket of suds.)

RAPIDLY VANISHING INDIAN LORE

By O. B. Anderson

EDITOR'S NOTE.—The following interesting article and drawings have been specially prepared for us by Mr. O. B. Anderson. For two years Mr. Anderson lived at Port Simpson as a missionary among the Tsimpsean Indians, and for another whole year was engaged in teaching. During this time he made a careful study of the Indians and their tribal customs and folklore. He made very exhaustive notes and his records of the ancient Indian mysteries are probably the most extensive and complete in existence. All the drawings are copies of actual designs that came under Mr. Anderson's personal notice. The Indians never draw in the style which we know as freehand. They use the old bark forms and elaborate their designs by laying these forms on hide, or woven material, and tracing them in outline. These forms are very valuable and are handed down from generation to generation. As the modern Indian is losing his old characteristics by coming into contact more and more with the white man it is probable that in another generation very few of them will possess or understand the meaning of these curious relics of their ancestors.

IN the redman's long ago, so the old *shimoigets* (Tsimpsean chiefs) tell us, Indian life was *ahm ahm* (very good indeed). Deep down in the bosom of the unsophisticated Indian patriarch, there lives this unswerving allegiance to the ancient fetishism of his fathers, which no sacrificial missionary effort can ever wholly eradicate. It is there to stay. Irresistibly he harks back to the clinging shadow of a half-forgotten or unknown past.

We may find him some fine day squatting in the hot sun on a long stretch of parched sea-beach chanting a dolorous monotone to the wash of the ripples which break gently at his feet. His head is bowed; his aged frame shaking. He is moving again among his tribesmen as one of the bravest chieftains out of a thousand long gone to the happy hunting ground. Utterly lost in the romantic past, he lives over the days full of fighting, fishing, painting, wandering, grotesque totem carving—the days when the glamor of *alheid* (Indian deviltry) was potent; when *shamens* (Indian medicine-men) with their bone and wooden rattles, shook soundness into the limbs of sick men or by their weird incantations sent straying far away the souls of bad men. In fancy he revels again in the solemn orgies of the dog-eaters and the human-eaters—dances again in the red fire-light of the long winter feasts or lies on the green sward at night-time under the dome of a summer sky

listening to the whisperings of *Shimoiget ga Lahaga* (God) the great Spirit-Chief of the Above, who spoke to the redmen from the stars, from the trees and winds and waters, revealing many secrets.

I had been a missionary among the Tsimpseans for about a year, when one day I talked long with Comx Clah, a renowned old Indian chief, about the traditions, superstitions and fetish practices of his early tribesmen. He proved to be full of native lore, but a real Indian in that he was unwilling to talk about it.

I asked him why the older Tsimpseans had not a deeper desire to forget all the bad past forever.

"I cannot tell," he answered simply, and then added: "Indian man not live like white man because he *want* to, but only because Indian man think maybe white man's way is right."

I opened my sketch book and showed him drawings that I had made of totems and war canoes, and various native designs imitated with infinite pains. This confidence pleased him. I besought him then to explain to me the meaning of some of the more hideous designs—to tell me how at first such figures came to be wrought out on wooden surfaces and skins or woven into mats of beaten bark.

His face lit up. He leaned thoughtfully upon his tall walking staff, the end of which was buried deeply in the sand. A

strange gleam kindled in the dim old eyes. A legend was forthcoming.

"Long, long time ago," he began softly, "maybe long before any white man in world—long before Tsimpshian villages came—when only few of our people lived here first of all, a great young chief—died—"

His voice grew stronger and clearer as his story grew, telling me how the spirit of the young chief appeared one night, rudely awakening the widowed squaw out of her sleep. The spirit bade her hie quickly to the forest and gather an armful of fresh young cedar bark. Out of this she was to cut certain reniform, spherical and other shapes which he had outlined on the wall in her absence. Then the spirit took the bark forms, about forty in all, bent over them and placed them together in many ways upon a large deer hide, chanting softly to himself all the while. With a brittle piece of charcoal he quickly made many outlines of designs, explaining each to his widow, by his weird song. When the morning dawned he vanished. In honor of this early chief it has ever been the custom to weave such designs into mats and baskets, to paint them on skins and canoes, and to carve them upon totems or boxes. To this day, though the arrangement may vary greatly, no other forms appear in a Tsimpshian design except those given by that wonderful spirit.

"That young chief and me," concluded the old Indian pointing to himself with high pride, "we belong to same clan—we *telicums* (relatives)."

As he ended his story Comx Clah ambled off to a canoe shanty standing near by. He beckoned me to follow. From a cache in the low roof he took a little bundle wrapped in buckskin.

"These the Indian patterns" he said, displaying the contents of his bundle on a patch of earthen floor flooded with sunlight.

The accompanying illustrations are a few reproductions from the pages of the author's sketch book. The notes in connection do not do them justice. In some cases very incomplete data could be obtained and in every case a good deal of the Indian romance is lacking in the absence of the unique personality of the Indian himself, who by his attitude and expression more than supplies what may be lost through his broken English. Unfortunately the young

Figure 1

generation who may have mastered English, perfectly are most ignorant of ancient lore.

Figure 1 represents the whale. This conventional design has been found on food boxes, variously painted and carved to the taste of the craftsman. The significance of the design depends largely on its position in the entire decoration and in the arrangement of the colors, if it is painted. As seen by the author it was placed at the very bottom of one side of a high food box, with two raven eyes above the hollow of the whale's back. The main lines appeared in black, the cross hatching and spotting in green, and the arrows, fins and spout in red. The design was said to read thus:

"I am a great chief of the whale crest, and this is my food box, which shall always be full. So full will it be that should a strong whale be concealed in its bottom, the weight of the food always resting above him, will make him spew out all that is inside (hence the arrows in the open mouth). I fish in the nighttime and sleep in the daytime upon green grass. Above are the criss-cross branches to shade me (indicated by the cross hatching). Around me good spirits are hovering in kindness, and I paint this great picture for the spirits to look at when no danger is near me."

Figure 2 is a conventional design used in the remote past to decorate root woven

Figure 2

hats, dancing gear and native blankets. The colors again appeared in red, green and black, and could be arranged in harmony with the thought that was to be expressed. Red standing alone would suggest warmth of affection; if rimmed with black, fiery indignation. Black standing by itself suggested night; if dotted with red, trouble; if surrounded by green, death or decay. Green was usually the symbol of growth or enlargement, when not in contact with any other color. The design is said to have been suggested by a cross-section of a salmon head, the wing-like appendages being a combination of fins added to emphasize the significance of the head. The design standing out in plain black, just as we see it in the illustration, would read: "Everything seems like night. Just as the salmon exist in silence and

Figure 3

darkness, but yet are alive (with their mouths open), so are we of the salmon clan. We cannot see our way, but we are not asleep. What we say is true (hence the wings), but it will not always be so."

Figure 3 represents halibut eyes. Here we see the fish eye design shorn of the wing-like appendages. On boxes and skins it seems to have been regarded as an especially good figure, but on native mats less desirable. As in Figure 2, the meaning of the design is clear only when we have the coloring before us and note the position of the eyes in the entire decoration.

Figure 4 is a rough drawing of a native food basket such as the North Pacific Coast

Figure 4

Indians used long before the Hudson's Bay Company were on the ground to supply them with the more modern metal cooking utensils. This basket took the place of our up-to-date stew kettle and was used in boiling soups and in the preparation of various entrees. It was fashioned by scooping out a single piece of wood. It might be over two feet long by more than a foot and a half wide. As it could not be placed over the fire an ingenious means was employed to heat the contents. Smooth round stones were made hot in the embers of the family fire, and dropped by twos and threes into the partially-filled vessel. Thus a vigorous bubbling was effected and at the same time a smoky savour was infused into the food, which was thought most desirable in these particular dishes. The figure on the front of the basket represents the face of an honored chief. The zig-zag and other lines on the sides were intended to distract evil spirits, who might be inclined to poison the contents by casting a malignant spell over it. The holes in the handles were not placed there for the fingers in lifting the basket, as might readily be supposed, but were hollowed out for the convenience of good spirits,

who were thought to be desirous of perching in some secluded place very near, to inhale the rich aroma rising from the hot food.

Figure 5

Figure 5 represents another type of food dish. Like the first it was wrought from a single piece of wood. Being shallow it was used more particularly to warm up foods or to keep them hot after they had been prepared by heating in the deeper dishes. Sand and hot stones were placed underneath and a light slab of bark laid over the dish to serve as a cover. The design in this instance is again of somewhat uncertain significance. It consists of a pair of "sleeping eyes" on the sides and one "half-sleeping (drowsy) eye" on the ends.

Since there is only one time when a live Indian may not eat, namely, when he is asleep, some have tried to make the design suggest limited rations. Then it might read to those around the board, something like this: "Help yourselves very sparingly, my friends, just as though you were already full and about to sleep." If this were the case the dish could only be used at times of straitened circumstances. When we remember, however, that such a suggestion would constitute an insult never to be forgotten by an Indian we are ready to put the more likely construction upon the design and read it as the greater number do: "Eat my good friends till you are so full that you cannot help sleeping."

Figure 8

the cross-hatching is that of the bear. Figure 8 represents the single eye of the beaver. Painted on boxes or skins it signifies an aggressive disposition in the owner.

Figure 9, the Indian adze and stone mallet. Here are two of the most useful implements in a native tool-kit. The forest and sea beach supply the crude raw materials. The blade of the adze is formed of a hard flint-like stone of a grayish green

Figure 6

Figure 6 shows a long boat-like food dish unadorned in any way. It was used especially in connection with dried foods, such as dulse, fish eggs, dried salmon and halibut and shell-fish. When "pilot bread" was introduced into the Indians' diet by the Hudson's Bay Company this long wooden dish became at once a suitable receptacle.

Figures 7 and 8 are both conventional designs again. The former represents the salmon just about to spawn. The eye over the cross-hatching is that of the raven; the eye to the right of

Figure 9

color. Probably many weary days of searching have revealed it at last among the unfrequented crags of a far-away forest-fringed shore beyond treacherous waters. With infinite pains it has been properly shaped and ground to an edge, then fastened to the well-seasoned hardwood crook with tough root fibres and doubly-strong native spun marsh twine. The Indian adze is

Figure 7

employed in the finer work of scooping out canoes and large food boxes, in the carving of great totems to do honor to the dead and in the building of the well-known native house. The handle of the stone mallet is usually carved or painted—sometimes both. The one in the illustration is carved only. As the head of the wolf is represented here, we know that this mallet is of the kind that might serve the double purpose of a hammer for building or a weapon in battle.

Figure 10

Figure 10 is a drawing of a native halibut hook. The two pieces of wood are bound together at the end by root thongs. The bone spur is fastened in place like-wise. The carving represents the raven with closed wings—a symbol of cunning. Figures carved thus on the great hooks are believed to aid greatly in catching the halibut.

Figure 11. Here is a sketch of a cedar bark device used by the Indian to bail water out of his canoe. It is made by gathering together the beaten ends of a strip of young cedar bark and tying them firmly together

Figure 11

with roots. This forms a scoop. The bound ends are then brought upward and fastened to a stick of wood, as shown in the illustration; this serves as a handle. The Indian woman gathers the bark but the man executes the work of making.

Figure 12

Figure 12 is a drawing of an Indian cradle. It is a highly decorated type. The great face at the high end is the moon face. It assists the child that may repose in the cradle, to slumber peacefully. The smaller

Figure 13

face at the other end of the cradle is the wolf face. No danger can befall the sleeping inmate while this face guards so faithfully. The side decoration consists of various eyes and a few foot-marks so combined as to express tender wishes and a number of dates of births.

Figure 13 is another conventional design. It is made up of the salmon head and two wolf heads one on either side. The design has been found on food boxes and long narrow root baskets, and is said to tell a weird story about a beautiful Indian chieftainess of the salmon clan, who married a brave chief of the wolf clan. They

Figure 14

had been living happily together only a short time, when the young chief was treacherously murdered by his own brother, who immediately forced a marriage with the beautiful widow. Driven to despair by ill-usage, the woman threw herself into the sea one stormy night and was never heard of again, except through the spirits.

Figure 14 is an unusually elaborate design composed of the twin figures (*hu-loi-mo shimoigatze*), the raven face, crab legs and various other vague symbolism. The twin figures are properly fit adornment for a food box, since the only significance conceded to them is that of a double invitation to eat (fill oneself full of food). The same figures, however, are found carved at the base of one of older totems in the southern borders of Alaska, and also painted in bright colors on a chief's door, in a village on the west coast of Vancouver Island. The raven face, which constitutes the upper central portion of the design, signifies that the chief in possession of the article on which the design was found, was of the raven crest and very rich in blankets, copper and green stone. The little heads under the fists of the twin figures give us to understand that two very powerful chiefs,

possibly of the eagle clan, have been completely subdued by the single daring of the chief of the raven clan. The crab eyes, bear eyes, copper representations and other symbols comprising the lower middle part of the design, speak volumes, but as explained before, must appear in colors before their meaning is at all clear. The colors used would be red, green, black and blue, the same rule holding good in regard to the significance of arrangement as in Figure 2.

Figure 15. When a canoe is in need of repairs or put by for any other reason, a rude roof is usually constructed over it, in some such way as shown in the accompanying sketch. Native bark-woven mats are thrown over this to keep the rain out. But it is often the case that the wind blows away the bark covering, and then all winter the canoe is more or less subject to the inclemency of the weather, in spite of the trouble taken at first. Owing to the long graceful prow and the pointed stern of the Indian canoe it cannot easily be overturned.

Figures 16 and 17 picture to us two hideous wooden dancing masks. The former represents the bear, the latter a hybrid of the wolf and eagle. They were both

Figure 15

Figure 16

carved, and painted to produce a most gruesome effect by a young native craftsman. The following is the story told concerning them: A long time ago a strong man of the Hydah tribe was taken in war and made a slave to the Tsimpshewan people. Always he wanted to go hunting but he was never allowed any great freedom, lest he might escape and return to his island home. One day, however, he succeeded in reaching the outskirts of the village, alone, and a friendly bear (who previous to this time had been a blue-bottle fly) crept quietly around the corner of a deserted long-house bordering the forest, and spoke thus to him:

"Good friend, you are now only a slave. Your people should have come over long ago and fought for your freedom. You are really one of their strong men. They have not done so. Therefore they must be punished. What can be worse than being only a slave! If you will come close to me and let me squeeze you tight with my great paws, you will become a spirit. Then you can appear before your forgetful people with a big bear's face and wide-open human hands like wings. This will frighten them in their feasts and in their dances. They will then be punished."

The slave, willing to become a spirit, advanced. But before the bear had time to take hold of him, a fierce wolf (who had been hopping about in the form of a toad

all this while) made his appearance suddenly. Down from a tall tree flew a great eagle and perched on the wolf's back with outspread wings. "Let us eat of your body—we are hungry—O let us eat of your body when the spirit goes out—we are so hungry?" they shouted together, so loudly that the poor slave became greatly alarmed lest they should arouse the men of the village and he be discovered. He nodded his assent to the wolf and the eagle just as the bear embraced him and his spirit took flight. Therefore he found himself in command of the additional power to appear before his forgetful people, with a frightful

face half eagle and half wolf. Not only did he scare his own people by such appearances before them, but also the Tsimpshewans, who so long had ill-used him as a slave. For years all the most important Tsimpshewan feasts and dances had been broken up by the sudden appearance of these two ugly faces. A happy thought at last struck one of the young men, a clever craftsman of his people. He carefully reproduced the two ugly faces of the apparition in wood, shaping them like masks. These he hid till the next great feast. Then he watched for the Hydah slave spirit.

Figure 17

When the big bear face appeared, he quickly put on the bear mask; when the wolf-eagle face presently showed itself he masked himself with the second mask. So terrified was the spirit at his own hideous

likeness that he disappeared, never again to return. The two famous masks are guarded jealously by one of the early missionaries, who counts them among his most valuable curios.

Editorial Comment

THE GOVERNOR-GENERAL

THE approaching visit of the Duke of Connaught to British Columbia provides us with an opportunity for definitely fixing in our minds the relationship of a governor-general to the national life of Canada. A governor-general is sure to be welcomed and honored by us because by virtue of his office he represents whatever of national dignity, power and worth Canada possesses as a result of the patriotism, commonsense and rightmindedness of her citizens—no more and no less.

In acclaiming him we are indirectly setting the seal of our approval upon those of our fellow-citizens, past and present, who have done something worth while for this country as a whole. The labors of the Fathers of Confederation (one of whom, we are proud to note, is spending the evening of his days in this province—the veteran Sir Charles Tupper), as well as the labors of such men as Laurier and Borden, and others still with us, find expression through the office of the governor-general. When our cousins in New York recently honored the Duke of Connaught they were paying a tribute to the Canada which public-spirited citizens have built up and made a mighty nation.

It is inevitable that here and there are individuals amongst us whose mental development has been arrested and warped so that they cannot grasp this fact. They could not be patriotic if they tried. Their eyes are turned inward so that they do not see Canada, British Columbia, or even the city in which they live. They see only themselves. These are the men who rush in where true Canadians fear to tread, and they humiliate only themselves by proposing "resolutions" that public funds should not be used for entertaining "royalty." Being self-centred they do not realize that

by withholding honor from the representative of their country they are publishing the fact that they themselves have never done anything for their country worthy of honor. These men supply the inequalities in human society, where they loudly claim only equality should exist. When these little men step up to the level of those who have by their patriotism and self-sacrifice made it possible for Canada to have a governor-general, all men will become more nearly equal.

Instead of carrying their own little private horizon about with them they should learn to look at the broad horizon of national life, the hindmost boundary of which is marked by the heroic labors of the Fathers of Confederation and those who preceded them in the task of laying the foundations of Canada, and the foremost boundary of which, the point towards which the eyes of all true Canadians are turned, is illumined by the rising sun of a glorious future of might, majesty, power and dominion.

The occasion of the visit of the governor-general—*any* governor-general—provides an acid test which these thoughtless citizens apply to themselves in the same reckless way that the untutored savage slashes his body with a knife for the good of his soul, and so demonstrate to us that they are *not* pure gold. The visit of the Duke of Connaught should remind us of the labors of those who made Canada a factor amongst the nations, and a growing influence for the good of our fellowmen throughout the world.

* * *

EARL GREY ON THE LABOR UNREST

EARL Grey's recent presidential address to the Labor Co-partnership Association contains much material of much more than the usual speech-making value. It is a matter of interest to every Canadian when Lord Grey has anything to say on any public question. The wisdom and generosity of his public service in Canada, the warm and sympathetic appreciation he has shown toward us and our institutions during the whole period of his public service here from 1904-1911, to say nothing of his larger and wider experience as an Imperial administrator, make it a matter of some moment when he advances an opinion on the subject of the national crisis.

The *Daily Mail* quotes from this presidential address some interesting selections. The first thing which would strike a disinterested observer in Lord Grey's attitude toward the labor problem is his willingness to face the facts in a thoroughly democratic spirit and with a broad outlook which entitle his words to profound consideration. He calls attention to the fact that since 1900, owing to the results of better education, the average standard of living has been considerably raised, and that while wages have risen only 3 per cent., the retail prices of food have risen 9.3 per cent. "Consequently," he says, "the manual workers find themselves in straitened, pinched, and most dis-

troubling circumstances The problem before us is how to organize our industry on lines the fairness of which will be generally admitted. Fair play is the keynote of our British character, and I am satisfied if employers and employed are properly approached, that wherever a feeling of mutual sympathetic regard exists between them they will both be prepared to consider fairly, and to meet fully, each other's just requirements. This is the belief on which we build our hopes of the future greatness of this country. Remove this belief and the outlook is one of blackest gloom."

Lord Grey deplures the fact that labor and capital in the industries of today are organized, not in one, but in opposing camps, "with the object not so much of promoting the common well-being of all connected with industry as of securing whatever advantage can be obtained in the prosecution of their common industry for themselves. The members of each camp consequently regard each other with distrust and suspicion. The capitalist is inclined to give the minimum that is necessary to secure the labor which he requires, and the worker in return considers that all that should be required from him is the minimum of labor which will save him from dismissal.

"Then not only have we to consider the limiting effect on the efficiency of industry caused by the fact that capital and labor are ranged, not in one, but in opposing camps; but we have also to consider the effect on the attitude of the men towards the management caused by the growing tendency of the small business to be swallowed up by the large combine. In such cases, the old feeling of mutual affection, confidence, and esteem, which in the past bound together employer and employed, has been destroyed, and it must be obvious that unless we can adopt methods which will restore in a new and perhaps in a more satisfactory manner the old spirit, the efficiency of industry and the prosperity of the nation will both suffer."

In answer to the question of what is to be done, Lord Grey presents the answer of co-partnership, and as to the ideal of this he says it is a system under which worker and consumer shall share with capitalists in the profits of industry.

"Under our present system the whole of the surplus profits go to capital, and it is the object of capital to give the worker the least wage for which he will consent to work, and to charge the consumer the highest price he can be persuaded to give; conversely it is the object of labor to give as little as possible for the wage received.

"Now that is a system which cannot possibly satisfy the requirements of a civilized and well-organized society. What we want is a system which will safeguard the consumer, and also provide the worker with a natural, self-compelling inducement to help the industry with which he is connected. That system is provided by co-partnership. Co-partnership insists that the workers have a right to participate in the net profits that may remain after capital has received its fixed reward. In a co-partnership business, just as the re-

ward of labor is fixed by the trade union rate of wages, so the reward of capital is fixed by the amount which it is necessary for the industry to give. That amount will vary correspondingly with the security of the risk attending the industry in question. If the industry is a safe one, it will be able to obtain the capital required by giving a small interest; if the industry is a risky one, it will be necessary to offer capital better terms.

"Then if there should be surplus profits available for division after labor has received its fixed rewards, namely, trade union rate of wages, and after capital has received its fixed reward, namely, the rate of interest agreed upon as the fair remuneration of capital; I say, if, after these two initial charges have been met, there should still be left surplus profits to distribute, that instead of their going exclusively to capital they should be distributed between labor and capital on some principle of equity."

Lord Grey proceeds to mention a number of cases illustrating the different phases of the co-partnership idea which have been attended by great economic success, and he comments upon them as follows:

"Now in these cases I have quoted, and I could refer to many others, a unity of interest is established between labor and capital, with the result that there is a general atmosphere of peace and of mutual brotherhood and goodwill.

"Capital receives the advantage of greater security. Labor is secured the highest rate of wage the industry can afford.

"Now what does the substitution of such conditions for the conditions generally prevailing today in England mean for our country? Who shall estimate the difference between the value of willing and unwilling service? The Board of Trade will tell you that a man paid by piece-work is generally from 30 to 50 per cent. more effective than a man paid by time.

"If the co-partnership principle, which is better than piece-work, because it tends to produce identity of interest between capital and labor, were to increase the efficiency of time-paid workers from 30 to 50 per cent., just think of the result, and yet the fact that co-partnership might add from 30 to 50 per cent. to the efficiency of the worker is urged by many trade unionists as a reason against co-partnership. They seem to fear that the result of making men co-partners will be to cause them to give 25 per cent. better labor and to receive only 50 per cent. more wage. No system can be right which is based on the assumption that self-interest calls for a man to give his worst instead of his best. When I compare Canada with England I am struck by the fact that whereas Canada's greatest undeveloped asset is her natural resources, England's greatest undeveloped asset is her natural resources, England's greatest undeveloped asset is man himself. How to get each man to do his best is the problem before England today. It is because co-partnership harnesses to industry not only the muscle but the heart and the intelligence of the worker

that we are justified in regarding it with reverence and enthusiasm as the principle of the future."

The frank recognition of the situation and the keen desire for fair play for everybody concerned, the recognition of the claims of all, and the reprobation of class feeling and class struggle are all indications of those elements of mind and heart (for the time has not come that both these elements are not essential in Imperial statecraft) which show Lord Grey as a statesman of the first quality as well as the first magnitude.

There are capitalists in the British Empire and their parliamentary representatives (generally lawyers) who would have the Empire run as to its politics and its business by the capitalist. There are laborites who also have their representatives in Parliament who would have the Empire controlled by the workingman. In other words, we find in industry the same narrow partisanship which we find in politics, and we estimate the outcome in a legal enactment which may be considered a counting of noses or a resultant of forces. The attitude of the real statesman in anything like a national crisis, as that for example which is admittedly the cause of the vast national labor unrest, is to find if possible some broader outlook or some broader foundation than anything which can be offered by class trouble for the solution of our national problems. This broader outlook is the one which is given by Lord Grey. In it he upholds the finest traditions of the British aristocracy in its treatment of the working classes who have been under them, in marked distinction some times and not to the advantage of the industrial classes.

Earl Grey is the type of statesman we should like to see prime minister of Great Britain. He is a friend of the operatives of Great Britain.

World Politics

The Panama Canal and Its Relation to the British Empire

By VAUGHAN CORNISH, D.Sc., F.R.G.S., F.G.S.

IN 1910, when I paid my third visit to the works of the Panama Canal, I was advised by the engineers to be there before May 1, 1912, in order to see the last of the excavations before the closing of the spillway, by which the waters of the Chagres River have hitherto escaped to the Atlantic Ocean.

Accordingly I sailed on March 27 last by the R.M.S.P. Oruba for Colon, and spent from April 15 to May 7 upon the works.

Sailing for England on the latter date, I only arrived at Southampton on May 31, the ship having been accidentally detained. Thus I have had little time before the last meeting of the session on the 11th inst. for the preparation of a written paper, the voyage itself being sacred to the observation of waves. By the aid of lantern slides, prepared from photographs taken by myself last month, I shall, however, be able to explain *viva voce* the latest stage of the canal works.

The plan of the completed canal is as follows: First, the formation of a sheltered basin in Limon Bay by means of one, and perhaps two, breakwaters. That from the fortified Toro Point on the west is nearing completion. The dredging of a channel, with a depth of forty feet of water from that depth in the Atlantic Ocean to the shore, and through the low swampy ground as far as Gatun. Here is a double flight of three locks, and abutting on their walls to the west an immense earthen dam which blocks the lower valley of the Chagres River. Through the centre of this great earthen mound is the concrete-lined spillway which is the controlling apparatus of the canal. The gates of this spillway were closed during my visit on April 30, and the waters of the Chagres and its tributaries are now rising behind its concrete wall and

flooding the low-lying country at the back, which will ultimately form Lake Gatun, a sheet of water which will cover more than 164 square miles. The final level of its surface will be + 87 feet, that is to say, 87 feet above mean tide. I shall describe later the stages by which this level will be reached. For the present I am speaking of the finished canal. The three locks will raise vessels to this maximum height of eighty-seven feet and they will proceed under their own steam and at a good rate of speed across the broad waters of the lake for about twenty-two miles to Gamboa. From here to Pedro Miguel, a distance of about eight miles, is a great artificial canon, the celebrated Culebra Cut. At Pedro Miguel a single-flight lock, in duplicate, lowers the ship to the surface of the artificial lake of Miraflores, about a mile and a half in length, and finally a double flight of twin locks lowers the ship to the level of the Pacific Ocean, and eight miles through low swamps and out to sea brings the vessel to deep water in the Pacific beyond the new port of Balboa, situated west of Panama. The Naos Island dyke protects this part of the canal from silting currents and connects the mainland with fortified islands. The total length from deep water in the Atlantic to deep water in the Pacific is about fifty miles. The Culebra Cut is being got out to + 40 feet, that is to say, 40 feet above mean tide. This gives a depth of forty-seven feet of fresh water when the lake is full at the end of the wet season, and it is intended to maintain a minimum depth of forty-one feet of fresh water in the cut throughout the dry season. The usable length of the locks is 1,000 feet, their width 110 feet, and the minimum bottom width of the Culebra Cut will be 300 feet in the straight. The greater width

at the curves will allow even large ships to turn under their own steam.

So much for the canal as it is to be. I proceed to describe its present condition and the steps by which its completion will be attained.

At Gamboa the river Chagres first crosses the line of the canal. There is at present a dyke here, the summit of which is at $+79$ feet. The waters of the Chagres are being allowed to accumulate at the back of the spillway until a depth of fifty feet is reached, which will flood all the valley as far as this dyke and will raise the water against the dyke ten feet above the level of the bottom of the Culebra Cut, which it protects from flooding by the Chagres River. The water will be held at this level until the end of the dry season, 1913. Meanwhile the concrete dam of the spillway will be built up to $+69$ feet, and the gates fitted above so that the surface of the water can rise to its full height. As soon as the lake has risen to $+79$, the height of the dyke, which it is calculated will be the case by August, 1913, the dyke will be dynamited and the water let into the cut.

Let us now see what has to be done meanwhile in the cut. Both ends are now down to the final depth of $+40$ feet. There is at the bottom a long, low mound three and a half miles long and twenty-seven feet high in the middle, which still has to be shaved off; and the full width at the bottom is not yet excavated for some miles. The main part of the work, however, which has to be done is the removal of "top weight" from the sides of the cut. This is the crux of the whole matter. Originally the sides of the cut were got out as for a bottom width of 200 feet, but in the midst of the operations an administrative order was received by the Isthmian Canal Commission instructing them to make the bottom width of the canal 300 feet. The means which were adopted to meet this sudden change of plan were not so judicious as those relating to other problems which had been elaborated with due forethought and care. The commission endeavored to achieve the object by steepening the sides of the cut. Since then the slopes of the Culebra Cut have been in a continual state of disintegration and collapse. I saw the whole process at its worst in 1910. It is still going on, but with diminished intensity. The most disquieting

feature was, and to a diminished extent still is, the bulging of the bottom of the canal owing to the weight of the high and steep banks, which attain in one place an altitude of 494 feet above canal bottom. My recent visit was undertaken largely for the purpose of forming an independent judgment as to whether the difficulties of these peculiar landslides, for which I propose the term "isostatic landslides," can be overcome by the date officially stated for the opening of the canal. The whole subject of landslides, isostatic and otherwise, is complex and difficult; and although of the very greatest interest I feel that its adequate treatment would be out of place in a paper for this institute, it being purely a matter of physical science. I therefore content myself here with the following statement, namely, that in the course of three weeks on the spot I carefully examined and estimated the difficulties of completing the Panama Canal, particularly those due to the phenomenon for which I propose the name of isostatic landslides in the Culebra Cut. I also studied the means which the commission possesses for coping with these difficulties; and, having had nearly six years' experience of the progress of Panama, it is my opinion that in the hands of the chief engineer, Col. G. W. Goethals, U.S.A., the difficulties will be so far surmounted that there will be a practicable waterway for ships some time during the autumn of 1913.

I will ask the reader to carry his mind back for a moment to the position of the dyke at Gamboa at the northern end of the cut, in order to follow the further stages by which this end will be achieved. The water of Lake Gatun having risen, as I have said, to $+79$ by August, 1913, and the dyke having been dynamited, the cut will be filled to a depth of thirty-nine feet. Meanwhile the spillway at Miraflores and the Pedro Miguel dam will have been completed. Dredgers will be brought from the Pacific, particularly the large dredger sent out from Scotland via Cape Horn, through the Miraflores and Pedro Miguel locks and will finish up any further excavation which is required in the Culebra Cut. As soon as the water is in, a ship will be passed through as experiment.

I draw attention to the circumstance that the confusion as to the dates assigned for the opening of the canal is largely due

to the fact that it is required for military as well as commercial purposes. The canal will be commercially usable before it is "finished"; for it is a military canal and will not be "finished" until it can fulfil the military purposes for which it is being constructed, which are the continuous and expeditious transportation of the whole of the United States fleet, with or without a number of large transports. For this the waterway must be cleared of, and safe from, obstructions, the machinery must be tuned-up to concert pitch, and the operating staff organized and trained to work the whole thing with clockwork-like precision. The canal will not be declared "open" until it is finished in the military sense, hence the confusing discrepancy of dates. The autumn of 1913 will be an experimental stage, scarcely suitable perhaps for passenger ships which cannot brook delay. 1914 will be a year of commercial use, during which all the traffic which comes along will be efficiently handled, though perhaps at times somewhat slowly. From January 1, 1915, the day of official opening, everything should work with promptness and precision.

A singular piece of work will have to be done when the level of the waters of Lake Gatun have risen to + 80 feet. Materials will then be taken in vessels far away into the recesses of the tropical forest on the upper waters of the river Trinidad. Here there is a low saddle in the hills, Cano saddle, the crest of which is at + 87 and by which the waters of the lake might escape to the Atlantic Ocean. Here a dyke 150 feet long will be built up to a height of + 105 feet, which is the height finally decided upon for the summit of the Gatun dam.

It will not be necessary for me to repeat here the story, which has been now so often told both by others and myself, of the complete stamping out of yellow fever in Panama, but for which the canal would probably not have been made. I will, however, mention some of the latest researches which have been carried out on the Isthmus in regard to malarial fever. The distance which mosquitoes fly is a very important feature in deciding upon means of prevention, and one very difficult to estimate. The sanitary department, having hatched the larvæ of *anopheles albimanus*, stained the adults and let them fly. It was found that

many flew 1,000 yards against a light breeze, and some as much as a mile. It has been found, however, that where breeding places cannot be done away with over a sufficient area much can be done to reduce the malarial rate by catching *quickly* the mosquitoes which enter the dwelling house. The importance of promptitude arises from the fact that every *anopheles* mosquito is harmless when she first comes from the forest. To facilitate catching, a low roof and light-colored walls are advisable. The following is an example of what can be done in this way. On a low marshy spot a gang of colored men were living in disused carriages of the Panama railroad. They were not supplied with quinine. A hundred yards horizontally distant from them, but on the summit of rising ground, in carefully screened buildings, was a camp of United States marines, who were daily dosed with quinine. In the railroad carriages the mosquitoes were collected twice a day; in the screened barracks of the marines there was no collection. The malarial rate was very much higher among the marines than among the men living in the old railroad carriages. Progress is also being made in the designing of mosquito traps.

In concluding this portion of my paper I must express the great delight and satisfaction with which I have revisited the Panama Canal works and met again those able and devoted men under whose care this great work will undoubtedly reach a successful conclusion. It is unnecessary for me again to testify to the remarkable qualities displayed by the chairman of the Isthmian Canal Commission, my friend Colonel Goethals, for they are now widely recognized and appreciated.

The Panama Canal is owned and will be operated by the government of the United States, and will be fortified and garrisoned by them. The foreign relations of the Republic of Panama, in which the canal is situated, are undertaken by the United States. By the Hay-Pauncefote treaty (1901) with Great Britain, the United States undertakes that the canal shall be open on terms of entire equality to ships of all nations, whether merchant vessels or ships of war, during times of peace and during hostilities.

The permanent relation of the Panama Canal to the British Empire is geographical,

and consists in the reduction of sea distances which it effects. These I proceed to summarize. I shall not attempt to deduce the consequences which may be expected, with more or less certainty, to follow in the future as effects of the relation; but I anticipate that this is the line which will be followed in a discussion which can hardly fail to be of considerable interest.

The following reductions of actual steaming distances are mostly based upon the figures originally published on the authority of the United States Hydrographic Bureau. For Vancouver, and all other ports north of Panama on the West Coast of North America, a reduction of 8,400 miles to New York, about 7,000 miles to Montreal, and 6,000 miles to Liverpool. The reduction to New Orleans is even greater than that to New York. The reduction to Antwerp and Hamburg is nearly the same as to Liverpool.

For ports on the West Coast of South America the reductions of distance vary from the above maximum at Panama to zero near the southern extremity of the continent. The average reduction is about 5,000 miles to New York and 2,600 to Liverpool. The distance from Yokohama to New York is diminished by 3,700 miles, the reduction to Montreal being about 1,000 miles less. Shanghai is brought 1,600 miles nearer to New York. The distance from Hong Kong to New York is not reduced, but Manila is sixteen miles nearer by Panama than by Suez. The only part of Asia which is brought nearer to Europe is part of the Siberian coast.

Sydney is brought 3,800 miles nearer to New York, by way of Tahiti and about 2,500 miles nearer to Montreal. Omitting the call at Tahiti the reductions are 400 miles greater. The distance from Melbourne to New York is reduced by 2,600 miles via Tahiti, and from Wellington, N.Z., by 2,500 miles. The distance to Wellington is reduced by a further 360 miles if the call at Tahiti be omitted. Yokohama, Sydney and Melbourne, at present nearer to Liverpool than to New York, will, after next year, be nearer to New York than to Liverpool.

Australia is peculiarly placed with reference to the routes by Suez and Panama respectively. Both will serve her trade with the manufacturing districts of Europe and of the eastern part of North America.

Thus, for Perth and Fremantle the Suez and Panama routes are about equidistant to New York, whilst Adelaide is about as far from Liverpool via Suez as it is from New York via Panama. East of Australia runs a north-and-south line in which all points are at an equal distance from New York, whether the Panama or Suez route be taken. Japan, Korea, the Philippines, and New Guinea, as well as most of Australia, are in the zone or band for which the Suez and Panama routes offer rival advantages. If we examine these distances from the point of view of a trader in the United Kingdom we shall be apt to note, probably, that although there is an absolute advantage for him, yet there is relatively a disadvantage as compared with the trader in the United States. This apparent disadvantage is, at all events for the present, discounted by the fact that the Americans do not carry their goods to foreign countries, but leave this profitable task to ships flying other flags, of which ours come first. We may look forward with confidence to the establishment by the great British and European steamship companies of services from European waters to New York and San Francisco via the Panama Canal, and on to Asia, connected, I presume, with other ships of the same companies at Hong Kong. Thus for the first time circumnavigation will be practicable north of the equator. The British West Indies are no longer at the entrance to a *cul de sac* but are placed on a highway of commerce. All are brought near to British Columbia. Jamaica becomes a position of first-class strategic importance to the whole Empire. Trinidad is on a new line of communication from the North Pacific countries to the ports of Brazil and the Argentine.

Although the engineers are so well advanced with their work at Panama, Congress is somewhat late in fixing the tolls and the conditions for the operation of the canal when made. The rate of one dollar per ton net register has been so invariably used as a basis of calculation by the experts that it is generally supposed this rate will be adopted; still nothing can be certain until Congress has said the last word, and, partly for this reason, it is likely that the amount of shipping passing through the canal at the time of its first opening may not be very great, for these things require time and preparation. But that the amount

of shipping which ultimately will make use of the canal will be very great is, I think, certain. The growth of the world's trade has gone on at such a rapid and increasing rate of late years that a canal which serves half the world is sure to be kept busy, and I have little doubt that ultimately this Canal, although built primarily for a military purpose, will bring in a handsome revenue to the American Government. As a great engineering people ourselves, we shall, I trust, extend a generous appreciation to the magnificent feat which the Americans have performed at Panama.

As friends and admirers of the French nation we shall not forget that the plan which has been followed for a high-level

canal is substantially that which was so skilfully drawn up by the French engineers; nor should it be forgotten that when they handed over the work to the Americans they had already excavated more material than the whole of that required for making the Suez Canal.

As a sea-going people we may congratulate ourselves on the approaching completion of a work which gives new advantages to sea transportation; and as rulers of a maritime empire we must look with satisfaction to the opening of a waterway which will diminish the formidable distances by which the unsociable sea separates the shores of our constituent countries.

* * *

British Columbia and the Panama Canal*

I SHOULD be very glad to say a few words if Mr. Cornish has not said all I wanted to say about the relations between the British Empire and this ample ditch. We are in danger that its real significance will pass by us, by reason of that curious freak of human nature that makes it almost impossible for any person to understand the full meaning of what is going on in his immediate time and in his immediate presence. One of the regrettable limitations of the human family which statesmen must reckon with is the inability of most men and women correctly to gauge the value of present and immediate events. They are likely to be long-sighted or short-sighted; they seldom see straight. What I mean is that it is very easy to overestimate the value of tomorrow's game of golf, and it is very easy to underestimate the importance of a project like the Panama Canal. Carlyle once quoted somebody to the effect that men look before and after; and he added the observation that the thing he wondered at was that they never looked round about them. Sometimes we take the trouble to anticipate, but mostly our faces are turned towards the past, and it is good for us to ponder the homely philosophy of Adam Bede, "I never knowed any good to come of a'watering of last year's crop."

To the seeing and thinking, several new and vastly important problems are presented by this canal, and several old ones are thrust with insistent persuasion upon all those who will have power to give serious attention to serious things.

*Speech made by Dr. F. B. Vrooman (Editor of the *British Columbia Magazine*) at the Royal Colonial Institute, London, on the occasion of the reading of Dr. Vaughan Cornish's paper on "The Panama Canal and Its Relation to the British Empire." (See Page 631.) Lord Brassey was chairman on this occasion.

Speaking generally, the Panama Canal, aside from its political aspect, bears a direct relationship to every natural resource of the British Empire on the Pacific Ocean, and that both industrially and commercially. Just what that relationship is today does not matter so much as what it will be when these vast resources shall have been discovered and developed, principally, so far as this argument is concerned, in Australasia and British Columbia, and when the new trade routes have been opened and occupied by British shipping.

We are also indirectly related, commercially, through the New Era inaugurated by this canal, to such resources of the United States as in the future shall be exported, and for which the United States has no shipping facilities. In other words, as to both the exports and imports of the United States, probably nine-tenths of which will be carried in foreign bottoms; and a goodly share of that is open to the competition of British commerce. All this means that if we like we may have our share in the natural resources of our own Empire on the Pacific, and a lion's share of the world's commerce on the Pacific, provided we have not definitely abandoned the Pacific Ocean to the yellow man.

Briefly stated, the relation of the Panama Canal to the British Empire is the relation of the sea to supremacy, of ships to the sea.

Nothing is more certain than that if we hope to profit by this new commercial world movement now beginning we must have an Imperial navy on the Pacific Ocean, not only worthy of the best traditions of the British race, but which will be adequate to protect all our new interests on that ocean, as well as all our old ones. But how are we facing this situation in this, the second decade of the twentieth century? We have withdrawn our navy and left our commercial interests to flourish by courtesy of the nation which is destined to be, and is already, our keenest rival on Western waters. If this is good statesmanship it is at least very bad business, for Japan has set out for the mastery of the Pacific, and she has assumed that role by our leave.

Unless the Empire is ready to go out of business there is no sane policy which may stop short of building battleships—and more of them. It is time for every Briton to understand that we are not confronting an easy situation. There are no possible solutions for our problems which do not involve expenditure and sacrifice. We must keep on building ships as long as we have iron to use, or gold to buy it with, and it is time we understood that all the British money which is now going into Japanese warships should be building British warships. We must come to this policy or lose the game. Indeed, I believe that we are approaching once more a heroic age in British history when we shall be called upon squarely to face again the "categorical imperative" involved in that word

made glorious and made British by many a national hero, the simple, plain, homely word DUTY.

But instead of facing the inevitable what are we doing? Instead of pursuing the policies which upheld Nelson and Wellington we are adopting a policy of economy, retrenchment and retreat. We have taken to farming out our defences. I wonder how many of us appreciate the humiliation of our position; but the humiliation of our position is not the only factor, there is the danger of it. We are drifting along in our lotus-eating policy toward slow Imperial suicide. We have called home our ships from the seven seas, and I remember the warning of Mr. Garvin a few weeks ago that the calling home of the legions heralded the downfall of Rome. You have withdrawn your fleet from the Pacific Ocean and left the defences of British Columbia and Australasia to the fleet of Japan. You are withdrawing your fleet from the Mediterranean and you are keeping your corn routes open by courtesy of France. The next logical step in this un-British programme is to turn over to Russia the defence of the Indian Empire.

This monstrous situation is raising in more than one breast the question "Is the Empire to break of its own weight? Are we no longer equal to the tasks of Imperial defence?" There is something shameful in such a situation, while there are men and money available in the Empire. There is something shameful in your putting British money in Japanese warships, if you have not enough money to put into British warships with which to defend the Empire.

We need once more an Imperial programme; indeed, we must have an Imperial programme if we are to remain an Empire. Let Canada and Australia co-operate with Great Britain at once in the construction of an adequate Pacific navy and an adequate Pacific mercantile marine to keep pace with the new expansion of trade and industry on the Pacific Ocean to be opened through Panama.

This Canal promises this Empire—if we are equal to the opportunity—an extension of its commerce beyond anything known in the history of the world before, beyond the prosperity of those days when seventy per cent. of all the ships which sailed the sea flew the British flag. But our present policies of Imperial defence will not only make all this impossible, but will render us unequal to competing even as a second-rate nation in the new birth of world trade, in the New Era of the New Pacific.

This canal promises this Empire an opening up in Australasia and British Columbia of harbors and cities which today are wild wooded inlets with here and there a fishing village or hunting camp. But if these harbors are to be defended by a Japanese fleet, they will become Japanese assets, and we shall live to see the fulfillment of that weird and doleful prophecy of Dr. Pearson twenty years

ago, who foresaw the gradual widening of the yellow zone around the Pacific Ocean, until white supremacy had passed away.

It is only too easy for us to rest on our laurels and to assume that is confronting the British Empire at the present moment and every moment, and which we must not forget, and dare not forget, that because we always have been secure and prosperous that we always shall be. We find it only too easy religiously to observe our holidays and enjoy our sport, and as assiduously to ignore the fact is the problem of the survival of the British Empire itself. It is all very well to turn proudly to our history and conclude from the great achievements of the past that we are to be invincible in the future; but the first thing required of every Briton just now is to face the new situation of a new world. We do not have to go back to Babylon to find evidence of the mutability of human affairs. We need not revert to the Middle Ages to find that national supremacies do not last forever. Gladstone and Disraeli had won their niches amongst the immortals before the creation of the German empire out of unorganized populations aggregating twenty-five millions of people, but which already has driven the British people to the strait of abandoning the defences of the Empire in the interests of the defences at home. Practically within two decades Japan has had its meteoric rise among the racial groups of men, and has forced a disturbing factor into the political equilibrium of the world.

Five years ago there was no government on earth more safely and securely entrenched in its institutions, its finance, its autocratic ruler than that of Mexico. The man who for half a century has dictated its affairs became an outcast from home, a fugitive from his native land, weltering in chaos. Five years ago no human being would have had the hardihood to predict a successful revolution in China; but this world's wonder has been accomplished and the ancient dynasty has been overthrown. One revolution may follow another, and who may prophesy what will be the outcome.

Whatever may be the millennial dreams of kindly and well-intentioned sentimentalists of that good time coming when every man shall love his neighbor as himself, and when the political arrangements of nations shall be conducted according to the golden rule, that time has not yet come. We are told of it in increasing armaments and in new national ambition; in wars and rumors of war and preparations for war. On the whole nations are still ruled by force, and the world is run by force. If this is true, then we must be that force. The Panama Canal is an insistent reminder that our supremacy is afloat, and that now, as before, and as it ever shall be, "England's fleet is her all-in-all."

*As small as your note book and
tells the story better.*

The
**Vest Pocket
KODAK**

A miniature Kodak, so capable that it will convince the experienced amateur, so simple that it will appeal to the novice. So flat and smooth and small that it will go readily into a vest pocket, yes, and dainty enough for milady's handbag.

And the Vest Pocket Kodak is efficient. It is small, almost tiny, but the carefully selected meniscus achromatic lens insures good work; the Kodak Ball Bearing shutter with iris diaphragm stops and Auto-time Scale give it a scope and range not found except in the highest grade cameras. Loads in daylight with Kodak film cartridges for eight exposures. Having a fixed focus it is always ready for quick work. Has reversible brilliant finder. Made of metal with lustrous black finish. Right in every detail of design and construction. Pictures, $1\frac{5}{8} \times 2\frac{1}{2}$ inches. Price \$7.00.

An important feature is that the quality of the work is so fine, the definition of the lens so perfect that enlargements may be easily made to any reasonable size, and at small cost—to post card size ($3\frac{1}{4} \times 5\frac{1}{2}$) for instance, at 15 cents.

Land Settlement in British Columbia

By J. HERBERT JENKINS

A RADICAL change, or, in other words, a revolution, is certainly taking place in the Old Country at the present time, and during the transition period the feeling of uncertainty and unrest is naturally causing large numbers of Britishers to seek fresh homes in over-sea lands, preferably under the Old Flag. In any case, Great Britain is overcrowded, or, rather, the towns and cities are, and there is little hope for improvement within a decade; but eventually affairs in the United Kingdom will be put on a better basis, and the rejuvenated nation will fully maintain its old ground in the place of power, for the benefit of humanity in general and its own people in particular.

In the meantime the tide of emigration is flowing strongly, and Canada, being the nearest of Great Britain's daughters, has, or should have, the advantage over the

other colonies. Whether it is good policy to rush unduly the settlement of the Dominion is a matter that can be discussed and discussed, and only posterity will prove the correctness or otherwise of the present system.

Of all the provinces, the climate of British Columbia is the most congenial, which is a big factor in the matter of settling the land; and, undoubtedly, British Columbia is the Mecca of all new-comers who are in a position to choose for themselves. Other provinces may have to assist settlement for their lands, but British Columbia has no need to assist settlers, as sufficient come of their own accord; and usually they are of the right sort, because they know the expense is greater to reach British Columbia than elsewhere.

The towns and cities of British Columbia are extending rapidly, and much is being done for the settlement of the lands. In the general order of things the wealth of the cities should reflect the prosperity of the country proper, but such is not the case in British Columbia today. Here we have very little in the shape of real industries to

support our cities, which are thriving on the abnormal prosperity due to the huge amounts being spent on railway construction for the opening up of the country. To some, that would appear to be a danger, but I am of the opinion that the whole of the prosperity is warranted and can be maintained, because the resources of British Columbia are unlimited, and as the country is opened up the tremendous areas of available land will not long remain untouched, so that revenue from products will more than equal the present heavy spending on new lines when railway construction begins to fall off.

British Columbia today is riding high on the wave of prosperity, and its credit stands second to none. It must, however, be borne in mind that this country is only an infant, and an infant whose growth is abnormal. There is so much to do that I am sure our statesmen must often feel that their best efforts are all too little. New towns are springing up on all sides, and every help must be given to foster the spirit of emulation. Rivalry is healthy, and each step in reclaiming wild lands and bringing them to the producing stage not

only means advancement for that particular district but also for the province as a whole.

All power to the splendid efforts of the government toward settling the land, and to those who are instrumental in doing the actual work. And all the more power to such efforts when the aim is to people the lands of this province with sons and daughters of the Old Country, members of our own race. We can be proud to welcome them, and they can be happy through the opportunities that British Columbia affords.

At one time I used to picture Canada as a huge sheet of clean blotting paper, and the stream of newcomers as a bottle of ink being poured over the blotter. Today, and each day, I realise that Canada is still the sheet of blotting paper, but each year's total of new settlers represents merely a scratch of the pen on the blotter, the Dominion is so vast.

And Vancouver, the port of British Columbia, will, as sure as the sun rises and sets, prove in time to be the New York of the West—with this distinction and advantage to the Britisher: he will still be living under his own flag.

The Western Route

CANADIANS have a hazy idea of the great development of Pacific trade to be expected from the operation of the Panama Canal. But few realize the great effect it is bound to have upon the transportation of Western grain, and, consequently, upon the profits reaped by Canadian growers. As things are at present, every hundred miles further west that the wheat grower is located means a reduction of a cent or so in his net returns. It is calculated that had the Panama route been in operation during last year's shipping season. Alberta farmers would have received at least \$3,000,000 more for their crop. Calgary is 1,250 miles from Fort William and only half that distance from Vancouver. From Calgary to Montreal is 1,000 miles more, and the rate is \$8.80 per ton, or, roughly, 40c for each 100 miles. At the same rate the haul from Calgary to Vancouver would be \$2.60 per ton. It is claimed that one ton of freight can be carried by water 1,000 miles for a dollar. From Alberta by the eastern route, the present rate is 28c in summer, or 35c in winter, and it is calculated that with the Panama Canal open the rate would be only 23c all the year round, an average saving of 5c in summer and 12c in winter. From Saskatchewan the saving would not be so marked, the present rate of 24c being retained in summer, but reduced from 31c to 27c in winter, while from Manitoba probably the reduction would be scarcely anything. All this is on the assumption that eastern freights would remain as they are now, whereas it is altogether probable that a general reduction would be deemed advisable by the railroads and eastern shipping agencies.

Another very important point is that there would be no dead season. Pacific ports are open all the year round and there would be no necessity for the present terrific haste to get grain away before the close of navigation. In this connection, however, there is one doubt which comes to

our minds. Greater care would need to be taken in shipping wheat by the Panama route, as the constant heat would tend to damage the grain unless properly dried.

NICHOLSON IRRIGATED FRUIT LANDS

THE LAND

THE valley of Kettle River, tributary of the Columbia, in Southern British Columbia, is already famous for the richness and high quality of its standard winter apples.

It is the choicest of irrigated fruit land, volcanic ash and sandy loam soil with gravel sub-soil, perfect natural drainage, most desirable altitude, most favorable climate, perpetual water supply and irrigation system already established, free to the owner.

Grows the finest of fruits right at the home of the highest priced consumer, within ten hours by Canadian Pacific or Great Northern Railways from Pacific Coast seaport cities.

British Columbia Irrigated Orchard Paradise

In Singularly Favored

Kettle River Valley

THE PRICE

THE beautiful Nicholson Estate has been cut up into irrigated orchard tracts of various sizes, all irrigated and ready for cultivation. We are now able to offer these superb tracts of 10 acres each, more or less, at from \$175 to \$250 per acre—the cheapest first-class irrigated fruit land ever offered anywhere, and \$100 per acre cheaper than neighboring lands.

Terms, one-fourth cash, balance in five semi-annual payments. We also arrange for expert cultivation of these lands at estimated cost.

There are but a few of these faultless fruit farms at these prices. Write at once for full information, detailed price list, maps, etc. No one may hope to see the like again.

ARDELL & KIRCHNER, Metropolitan Building, Vancouver, B. C.

WHITE ROCK AND BEACH

**Enjoy the Sea Breeze
at Beautiful**

WHITE ROCK

It is the ideal camping and summer resort. Only sixty minutes' run by the G. N. R. from Vancouver, it possesses advantages not to be found at any other resort on the Pacific Coast, *i.e.*, a splendid, clean, firm, sandy beach, rendering bathing safe and ideal; first-class train service (both local and express trains stop at White Rock); good and abundant drinking-water; delightful scenery; post office with daily mail; and three stores. Choice lots facing the sea can be had now. Go down and select your camp site for this summer's use. The railroad fare is \$1.35 return for the week-end from Vancouver, and 80 cents from New Westminster; there are four trains each way daily. If you purchase this month we can quote you special prices and terms.

SUPREME

in the

Traveling World

To Travel East on

The Olympian

is to travel amid every convenience and luxury of the twentieth century. Unique in its conception and sumptuous in its appointments, "The Olympian" represents the very height of accomplishment in railroad equipment and service. Factors that appeal to the critical and discerning passenger are the distribution of "Olympian-grams," giving bulletins of the important events of the day, and the afternoon serving of tea in the lounge observation car—which occasion is presided over by one of the lady travelers. Other features are the scrupulous train cleanliness; made possible by the vacuum cleaning system; the advantage of long distance telephone connection at stations; the convenience of library, writing room, barber shop, bath room, clothes pressing, men's club room and buffet; and the comfort of berths that really are "longer, higher and wider" than on any other road.

Traveling becomes a pleasure on this palatial train as it speeds onward over "the shortest route to the East."

MILLIONS OF TINS OF SALMON ARE EXPORTED ANNUALLY FROM BRITISH COLUMBIA

Civic Growth

For the month of July, Vancouver gave ample evidence of a steadily increasing development in commercial and financial activities. Following are the month's returns compared with July of last year:

	1912	1911
Customs	\$ 810,184.00	\$ 519,451.00
Land Registry	24,493.62	20,280.02
Buildings	2,074,012.00	1,108,378.00
Clearings	53,840,212.00	43,239,102.00

The building returns for the seven months of 1912 totalled \$10,206,732.00, representing 1,370 permits.

In the Land Registry Office during June and July more mortgages were released than ever before in the history of the city.

Manufacturers

pay no taxes on their buildings, on their machinery, or on their stock in Vancouver. Two power companies supply electric heat, light and power at competitive rates. Water and rail transportation facilities assure Vancouver a place among the great commercial centres of the world.

Liquid Sulphur Cures

Rheumatism, Eczema, Stomach and Kidney Troubles--Skin Diseases

Why? Read These Facts

Because Liquid Sulphur is the greatest known blood purifier of the century. Everyone knows that sulphur is good for the entire system. Almost everyone has taken sulphur in some form or another. But is it known to you that sulphur in its powdered form cannot be assimilated into the blood through the stomach? If the stomach cannot dissolve sulphur, how can the blood be purified? Liquid Sulphur is already dissolved, is in fact ready for the stomach to distribute through the system. Liquid Sulphur goes direct to the seat of the trouble, impure blood, attacks and drives out of the entire system all germs and impurities. IT REMOVES THE CAUSE AND PERMANENTLY CURES.

Do Not Accept a Substitute

Who We Are Where We Work, and What We Are Doing

THE name of this Company correctly and exactly indicates the sphere and scope of its business. It was organized to develop, and to bring to the attention of people of large or small capital, the investment opportunities offered by the Natural Resources of British Columbia.

Agricultural lands in large or small tracts, timber limits, waterpowers, mineral claims, townsites—these and kindred properties form the field of our operations.

In every case the money of the Investor is backed and secured by physical values, rigorously investigated, authenticated and guaranteed by us.

This is the Company that first foresaw the future of FORT GEORGE, and that made the name of British Columbia's future city a household word throughout the Continent.

Hundreds of its clients, from Vancouver to Maine and Mexico, will testify to the profit-making character of the investments recommended by the Natural Resources Security Company, Limited.

The upbuilding of the organization of the Company has been the work of years. It is today the largest and most efficient of its kind in Canada, and for the development and sale of investments based on Natural Resources is rivalled only by those of governments and the great railways.

Central British Columbia is today the Land of Opportunity for men of large and small capital. Railways are racing into this rich region. Settlement is pouring in. Cities are being built. The foundations of fortunes are being laid.

On September 1st, the Head Office of the Company will move from Vancouver to Fort George—the Railway Centre and Natural Trading Place of British Columbia's Inland Empire.

This transfer will keep us in even closer touch with development and investment opportunities, and enable the Company to serve, with even greater success, the clients it has interested in the district's growth and progress.

The Company's organization and its direct, intimate and specialized knowledge of Central British Columbia are at your disposal. A letter requesting information regarding investments will have our prompt and careful attention.

SALE

Prince Rupert Lots

ACTING under instructions from the Government of British Columbia, I will hold an auction sale of Prince Rupert lots on Wednesday, August 28th, 1912. The sale will be held at Prince Rupert, and will commence at 3 p.m., and will be completed on Thursday, the 29th.

The lots to be offered will be in Sections 1, 5, 6, 7 and 8, about 300 in all, and the list comprises some of the choicest lots in the townsite.

Take Canadian Pacific Railway and Union Steamship Companies' boats August 24th, or Grand Trunk Pacific boats August 26th. Fare each way, including meals and berth, \$18.00.

It will pay you to attend this sale. If you cannot go yourself send a representative.

FOR FURTHER INFORMATION APPLY TO

C. D. RAND

Head Office: VANCOUVER

Branch Office: PRINCE RUPERT

FORT GEORGE

Will Command the Trade of Central British Columbia and the Peace River

IN PROOF OF THIS ASSERTION, NOTE THE FOLLOWING FACTS:

1. Fort George will be the focusing point of every railroad built into Central British Columbia.

Eleven railways are chartered or building into Central British Columbia. Every one of them goes into Fort George.

2. Fort George is the centre of over a thousand miles of navigable waterways.

From Fort George to Fraser Lake, 120 miles; from Fort George to Tete Jaune Cache, 300 miles; from Fort George to Soda Creek, 165 miles; boats are today in operation over this 600 miles. In addition there is the Salmon River and the Stuart with their splendid connected lakes.

3. Fort George is the centre of a region of enormous and varied natural wealth.

Hundreds of thousands of acres of the finest mixed farming land; gold, anthracite and bituminous coal, silver, lead, iron and zinc are among its minerals, and there are thousands of acres of the finest timber.

4. Fort George has not, nor can it have, any commercial competition within its territory.

Vancouver is 450 miles to the south, Edmonton 320 miles to the east, and Prince Rupert 460 miles to the west. Fort George's Tributary Commercial Territory is twice as large as Great Britain and almost as large as Germany.

5. Fort George is the natural commercial base for the great Peace River Country.

The products of this rich district, which has 40,000,000 acres of good farm land, will come through Fort George down to Prince Rupert or Vancouver. It will do this because the rail-haul to the Pacific is less than half that to Fort William or Port Arthur. Every pound of freight going into the Peace, and every bushel of grain or head of stock coming out, will go through Fort George and build up the future city.

We were the pioneers in directing public attention to the investment opportunities of Fort George and district. Much money has been made by those who made investments in the Fort George country. Much more will be made in the next few years. Our knowledge and experience of the investment opportunities of Central British Columbia is at your service. Whether you are interested in townsites, land for purchase, timber or mineral lands, or openings for manufacturing industries or business, write us.
